metal, giving it a tendency to check and crack. Also, the temperature may under such conditions be started too soon. The appearance of the surface of the metal to the eye is misleading. The surface, cooling much more rapidly than the interior conduction of heat from the latter to the former during the tempering, may affect it. After all, it is not so much the matter of heat as it is in the matter of controlling it and knowing how it is acting that affects the tempering.

THE iron cap of copper-bearing veins is ordinarily a limonite iron ore, occasionally a hematite and, more rarely, magnetite. In the latter case it would appear that the ore deposit is an enrichment or local segregation of mineral from the fluid or semi-fluid eruptive, and the magnetite an original mineral. Where hematite or limonite, the latter sometimes being known as gossan, forms the capping, it is the result of oxidation of pyrite and chalcopryite, the sulphur disappearing into the atmosphere and the copper leaching out as sulphate, to be reprecipitated about the permanent water level of the ore body. In a region where copper is known to exist it is always safe to prospect into any iron ore croppings that exist in search of copper ores.

THE perpetually frozen gravels of the Klondike are being successfully hydraulicked by first uncovering the gravels so that the sun heat has a chance to thaw them out. The removal of the moss permits the hydraulicking of 2 to 3 feet of muck immediately underlying it. The sun heat then thaws out an additional depth which can then in turn be hydraulicked. The water itself assists the thawing and by distributing the washing over a comparatively large surface it is practicable with a continuous water supply and good dump to clean up a correspondingly large bedrock area in the short Arctic summer. The cost of this work is very much less than methods of drifting employing steam thaws and it has the advantage of working the ground clean.

WHILE wet concrete, even to a degree of slushiness, is used in some cases, general practice and the weight of opinion appears to be decidedly in favor of using concrete pretty dry, and relying upon good ramming to fill the voids, the consistency being such that thorough and hard ramming is necessary to cause water to flush to the surface to show a quaking motion in the mass. One authority, however, states that, as a general thing, excess of water is preferable to an insufficiency, for the reason that the concrete may be laid in a trench in porous soil, which will absorb some of the water, or the materials of the aggregate may be porous and also absorb water, while with a quick-setting cement and a minimum supply of water, there may be danger of the concrete setting too quickly.

IN the manufacture of vitrified brick the shale is first crushed dry, ground and screened, the oversize being returned. For screens, an 8-mesh can be used, but a 16-mesh is preferable. The brick are molded in stiff-mud machines with dies, making end-cut or side-cut brick. A second pressing is frequently given to smooth corners and make the structure denser. A variety of kilns can be used in burning, but the down-draft type is considered preferable as affording a better regulation of the heat and the obtaining of the greatest heat in the top of the kiln. The burning takes from seven to nine days and is not hurried, sufficient time being allowed to let the brick shrink slowly and for the kiln to become uniformly heated, before the temperature is raised to the vitrification point. At this temperature the kiln is closed and remains undisturbed for several days.

A NEW METHOD of determining approximately and quickly the amounts of free lime and of gypsum in cement is described as follows: Use ten grammes of the cement and put it into 400 c. c. of water in an ordinary 500 c. c. tubular measure, with 100 markings and about 10 inches between zero and containing mark. Cork and shake up for a couple of minutes, so as to mix well. Twist in fingers to get equal settlement of the cement, and stand by for an hour so as to clarify. Then, from a saturated solution of ammonium oxalate, pour in up to the 500 c. c. mark. At once a white cloud of lime oxalate will form, which allow to settle for a couple of hours and note height above the cement. Each graduation mark will equal 1% free lime in the cement. A saturated solution of barium chloride will reveal the presence of gypsum in the same way, but in this way one-half a graduation will indicate 1%.

THE comparative cheapness of a ditch water supply or a pumped water supply for hydraulicking in the Klondike and other Arctic districts depends on the particular mine to be exploited. The cost of either has to be paid by the gold coming out of the mine. The capital investment for the ditch supply will be larger than for the pump plant. The operating expense of the latter will be the larger. The comparison is made of the sums that it is estimatable each will have cost the mine when the latter is worked out. On even cost estimates the pump plant is preferable as involving the least risk and offering the quickest returns. The pump plant can be run for supplying water for hydraulicking at its maximum efficiency under a constant load. The prime mover power need not be steam. It may be electrically transmitted water power or it may be direct water power. A large volume of water used under a low head on a water wheel to provide power to lift a small volume to a considerable elevation, or the large volume may be used in a hydraulic ram or battery of hydraulic rams. Very high heads are not required for hydraulicking the known Alaska placers; none of the gravels are cemented.

## Compressed Air Traction Plant, Red Point Mine, Placer County, Cal.\*

Written for the MINING AND SCIENTIFIC PRESS.

The Red Point mine is a gold placer situate in Placer County, Cal., on what is locally known as the Forest Hill Divide, 15 miles toward the summit of the Sierra Nevada mountains from the town of Forest Hill. It adjoins the Hidden Treasure mine and, like it, is exploited as a drift mine. Both are sections of Neocene river channels which were obliterated as such by filling to depths of a thousand feet or more by volcanics. Subsequent erosion of new stream channels, replacing those buried, has cut the country surface in deep canyon lines across and alongside of the old channel beds until the latter were left part of existing mountain summits. The method of drift mining developed from the physical position of the gold-bearing placer in the heart of the mountain consists in driving tunnels through the solid rock rims of the side of the mountain, so that they enter the unconsolidated gold-bearing gravel beds of the old channel beneath the covering of volcanics. The tunnel then furnishes a gravity drainage outlet for large flows of underground water, collected in and following the old stream beds, and the gold-bearing gravel is attacked and removed much in the manner of the mining of coal. It is the winning of a horizontal-lying deposit of ore as contrasted with the winning of a proximately vertical-lying deposit.

The Red Point mine is notable from the mode in which its discovery was made. Unlike most of the

tance, with up-hill gradients varying from 1% to 3%, the total rise is 240 feet. The fast-increasing distance of haulage some years since compelled a change from the use of horses. The loaded cars run out of the mine by gravity under the brake, but the haulage with the grade and distance to be overcome was the difficulty. The installation made and now in operation was designed by H. C. Behr, mechanical engineer, then of San Francisco, but now of Cape Town, South Africa.

The choice lying between electric traction and compressed air, the economic conditions made the decision in favor of the latter. The workings in the channel were more or less uneven in height, dependent on the full depth of the gravel, which was all mined out. The roof consists of a hard, compact volcanic cement. For mining the gravel it was not necessary to remove this or the bedrock on which the gravel rests. The latter is cut down in the tunnel to provide a more even track floor, a better water drain channel and to give sufficient height for traction. The roof of cement is, however, kept unbroken. The illustration on this page shows the relation described, the tunnel track cut in the bedrock, the breast in the gravel on the unbroken bedrock, and the solid rock roof, which, unbroken, only requires posts to hold it.

The installation of electric traction would have required a very large expense in cutting the roof, and extra expense in wiring the trolley, owing to turns and irregularities of the tunnel. There is practically no tunnel timbering to which the trolley insulators could be attached. Since the compressed air installation for traction was made in the Red Point mine, an electric traction installation has been made in the

Hidden Treasure mine, adjoining. This is described in Vol. LXXIX, page 604, of this journal. In this installation the difference of initial cost was in favor of the electric installation. The tunnel is everywhere timbered and did not require any additional cost of cutting to provide for putting in trolley wires. In both cases the operating prime mover was the water flowing out through the mine openings. The two different systems of traction installed in the two adjoining and similar mines, each in its particular place the most economic for that place, shows how impossible it is for broad generalizations to be made as to comparative economy between electric and compressed air systems of traction. Each mine is a problem by itself, demanding economic solution, not from generalizations from practice elsewhere, but from the special conditions as they are found to be in the partic-

ular mine. In the Red Point mine the mine waters are the prime mover for power for all purposes for which power is used. The water is first caught up and turned into a pipe well up toward the inner face of the upstream workings. This pipe delivers the water under the head of the tunnel fall to a 36-inch Pelton wheel, located in the tunnel about  $\frac{1}{2}$  mile from the entrance. This water drives a No. 4 Baker blower, giving its positive pressure as an addition to the air pressure in an 11-inch pipe from a blower outside of the tunnel. From this Pelton wheel the water flows through the tunnel to the entrance, where it is divided. The total quantity of flow is 70 cubic feet a minute. Of this, about 30 cubic feet is conducted to the storage tank, to be used for washing the gravel. Forty cubic feet is turned into a pipe leading down the mountain slope and is used under 103 feet head on a 36-inch Pelton wheel, driving a No. 4 Baker blower. These two blowers and the single 11-inch pipe line, conducting the air to the workings in the face, ventilate the mine.

After use driving the blower the water passes through a head box into another pressure pipe line. Under several hundred feet pressure the water operates a 5-foot Pelton wheel, driving a three-phase Simmons air compressor, which compresses 120 cubic feet of free air per minute to 800 pounds to the square inch pressure. From the receiver a strong 2-inch pipe conducts the air 3500 feet to the tunnel entrance and 11,500 feet farther into the tunnel. In addition to providing several convenient charging stations, the long pipe acts as a receiver, giving added storage capacity.

A six-ton air locomotive, with a storage capacity of 60 cubic feet of compressed air, takes the air from the charging stations at 700 pounds pressure. The illustration on the front page shows the locomotive. From the large receiver on the locomotive the air passes through a Foster reducing valve and is reduced to 200 pounds pressure. It is then reheated to 300° F. and, passing into cylinders, is used in all respects as if it were steam.

The locomotive takes sixteen to eighteen cars into the mine at a trip, at a speed of 9 miles an hour. The engine is charged before starting into the tunnel and takes a second charge in the tunnel. A single charging will run it up the tunnel grade with the train of empties for 2 miles. Coming out, the down grade of the track takes the loaded train out of the tunnel by gravity. The track consists of thirty-pound rail and ties are placed 1 foot apart.

The mine employs sixty-five men. The output of gold has been quite uniform through the entire period of operation. Variations in width of the channel and quantity of gravel have been found to be compensated to some extent by opposite changes in the quantity of gold content. With the adjoining Hidden Treasure mine the Red Point mine is a typical drift mine, representing in its operation all the perfection and detail and economy of cost that experience in this kind of mining has suggested.

### From Nome City, Alaska.

TO THE EDITOR:—I would advise, after having had experience, California miners and others to stay at home and a long way from Nome. Use as much energy in developing a mine at home as we do here to find one, and you will be ahead of those who come here. To those who are thinking of coming here, hoping to find work, I would advise to "stay where they are." There are already ten men to each chance of employment, and there are a number of men here now begging for work.

In the winter there is no work to be had. There are three months in the year in which mining can be accomplished—July, August and September. The remaining nine months bring no income. Shovelers out on the creeks are paid \$5 per day and board for ten hours' work, and at some places they get their pay provided it is taken out of the claim. It will cost one man \$500 to winter here. Every steamer from the outside comes in here loaded with hundreds of men, and very few of them have enough money to last them over a month. The business houses of Nome are not doing the business that a California mother lode town would do. The money in circulation now comes from Dawson and the States. There is very little gold coming in from the creeks up to this date.

The country has been well covered and there is not a spot of ground unstaked in the district. I have just come in from a 30-mile mush and find it staked to the mountain tops. There is a vast territory here, but it is not all good. The creeks are very spotted. There are a few good creeks about 5 miles from here that have proved very rich. Anvil creek, where the first discoveries were made, comprises thirteen claims. Dexter, Snow, Glazier, Dry and a few other creeks are very short and comprise the cream of this district. I think it reached its zenith this last season.

The beach is now being worked over for the third time, mostly by men who have been out on the creeks and found their claims no good. The beach sands all carry fine gold—so fine that silver plates are necessary. Two men and myself rocked on the beach all day and cleaned up \$1.70—and we had as good a prospect as any of the others.

Stampeding and staking in the winter has proved very unsatisfactory, as the whole country is covered with snow and ice and no prospecting can be done.

There are miners coming in from the Bluestone, Arctic and Kougrock districts every day with very discouraging reports. Men who have claims to sell are trying to boom the country. To get a claim that has not been located one would have to go up in the Arctic district. It is my opinion of this part of Alaska that it is overrated.

Nome has a population of about 5000. It is estimated that there are 40,000 prospectors in this portion of Alaska this season. WM. G. ANDERSON.

Nome, Aug. 8.

### Electric Energy From Wind.

From long and careful studies of the atmospheric conditions in northern Germany, M. G. Couz of Hamburg has taken up the question of the industrial application of the winds which are always abundant in that region. He has discovered a system of electric regulators to obviate the inconvenience of variation in the velocity of the wind. To put his ideas in practice, Herr Couz appealed to F. Neumann, a manufacturer of windmills at Wittkiel, who put a large windmill at his disposition. The wheel had a regulator to keep its speed constant for a certain number of turns when the minimum velocity of the wind to keep it moving at that speed had been exceeded. This wheel, which in a tempest can furnish 30 H. P., charges a large storage battery for electric lighting and power at Wittkiel. Some experiments were made last September and the results surpassed all expectations. These experiments, which were admirably conducted, make it possible to hope that small localities, will be able to secure electric light and power from the wind at almost no cost. The expense of establishing such an installation is extremely small in comparison to the immense advantages which it secures.

Three Miles Underground, Red Point Mine, Placer County, Cal.

California placers, the locus of which was discovered in the early mining days, even if not then mined, the existence of this particular gold-bearing placer is a comparatively recent development. J. B. Hobson, at that time (1885) of Placer County, but now manager of the Cariboo Con. Hy. mine, at Bullion, B. C., deductively from the geology becoming satisfied that the gold-bearing old river channel traversed the ground, now the Red Point, located and bought the area and interested French capital in its exploration. Ross E. Browne, M. E., of San Francisco, then made an elaborate survey of the ground and adjoining mines that were being operated and made a proximate location of the line and elevation of the old buried channel, and what is now known as the Red Point tunnel was projected and run to develop the channel. The method of location employed—a practical application of topographic and geological surveys—was novel then. Very little of that class of work had been done then, and none on so large a scale, or for the development of a channel that was buried throughout its whole extent for many miles and only doubtfully identified in the underground workings several miles apart. The tunnel projected by Mr. Browne proved successful, striking only 15 feet below the bed of the channel at 2000 feet, the projected distance having been 2400 feet. The close determination of the actual geological facts in advance, deductively in this instance, was a brilliant demonstration of a theory applied. Descriptions in detail of this work appear in the VIII Annual Report of the State Mineralogist of California, page 749, and following, and in Volume LXVIII of this journal, pages 151, 165, 181.

The Red Point mine has been operated continuously since 1887 and has been continuously a profit-earning mine. The main tunnel, following the turns of the old channel, has been extended until the face of the working is now about 17,500 feet from the entrance to the tunnel, nearly  $3\frac{1}{2}$  miles. In this dis-

## The Redridge Dam.

The extensive works being carried out by the Atlantic Mining Co. and the Baltic Mining Co. under the direction of their agent, Frank McM. Stanton, M. Am. Soc. C. E., for the development of their properties in the copper region of northern Michigan, include the construction of a high dam on the Salmon Trout river, at Redridge, Mich., to furnish water to the stamp mills. The site is only a few hundred feet from Lake Superior, and the crest of the dam will be about 84 feet above the normal lake level.

The Redridge dam is unique in being a gravity dam of combined concrete and steel construction, and in fact it is the first of its kind. Upon the concrete

Along the rear of the dam extends a steel trestle for a railway track.

**FOUNDATIONS, ETC.**—The dam is founded on bed-rock for its entire length, except under part of one core wall, where an impervious clay was encountered. The rock is hard, strong and generally free from fissures; but it has been more or less eroded at a point a short distance above the present dam site, where a wooden dam with crest some 20 feet lower than the present dam has stood for many years.

To guard against the possibility of water working its way from these eroded holes between the rock strata, and finally underneath the new dam, the novel plan was devised of making an impervious cut-off dam in the natural rock above the site of the new dam. This cut-off dam was made by making a line of drill-

ment, with concrete core walls extending back into the hillside, the core walls being supported by earth embankments. The abutments serve for both the dam and the railway structure. Beyond the end bent of the steel work, and forming an extension of the steel face, extends a plate about 4 feet wide, with a steel angle riveted along the outer edge. The plate and the end bent are embedded in the abutment, and thus firmly anchored. The abutment is bonded to the core wall by steel rails put together in pairs, with 2-foot anchor rods between them. These are embedded horizontally in the concrete.

Some measurements of concrete in place indicated a weight of 165 pounds per cubic foot, and tests of 6-inch cubes have shown a crushing strength of 1800 pounds per square inch at twenty-six days. The per-

missible loading under bearing plates is limited to 200 pounds per square inch, and at these places also a special concrete is used. On the main body of the dam the pressure induced by the water is very much less than this. In the calculations, the weight of the concrete was assumed at 145 pounds per cubic foot, so that the actual structure has an excess of weight. The concrete is mixed comparatively dry, with only enough water to flush to the surface during ramming. There are about 8000 cubic yards of concrete in the main dam, and about 2000 cubic yards in the abutments and core walls.

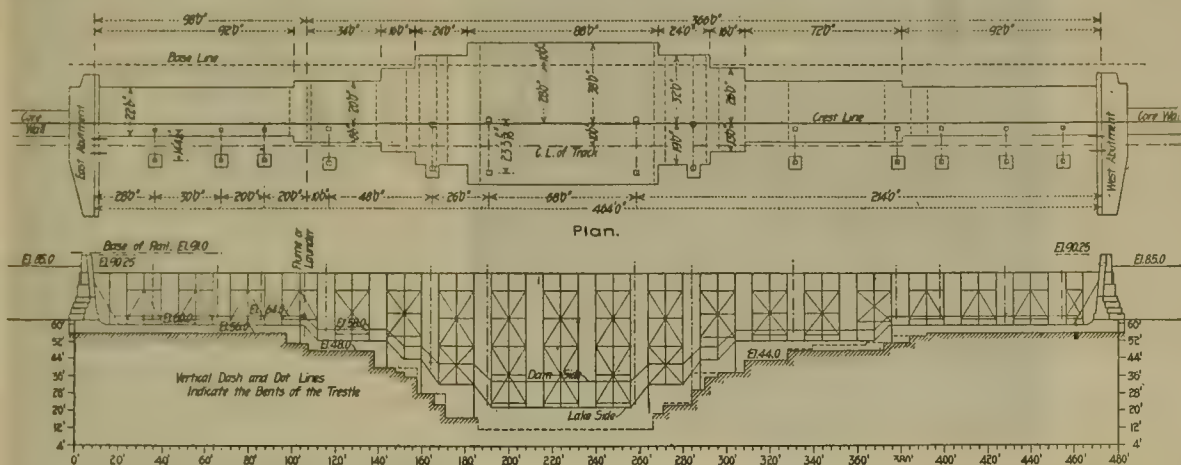

The profile of the upper part of the concrete is inclined, to conform to the slope of the steel facing, the beams of the steel bents being embedded in the concrete, as shown. The concrete extends up behind the steel facing, and forms a bench where the curved steel face plates end, this bench being covered by an inclined diaphragm plate. To secure plane contact between the

To ensure close contact of the steel and concrete, holes are tapped in the diaphragm plate, to which nozzles for grouting pipes can be screwed, the grout being forced in behind the steel under a pressure of about ninety pounds. The concrete was not built to its full height at first, but only far enough to receive the steel work. Upon this the separate bases for the steel columns were built in forms, in such a manner that these will be embedded in the upper mass of concrete. To ensure the proper position of the anchor bolts, the forms for the column bases had frames attached so that when the forms were in position the ends of the rods rested upon the frames in the positions they occupy in the finished work.

**STEEL SUPERSTRUCTURE.**—The steel portion of the dam is 464 feet long on the crest, between the concrete abutments, and consists of a series of steel bents or A-frames, 8 feet apart, to which is riveted a facing of steel plates. These bents are braced together in sets of three, as shown by the elevation in Fig. 1. Typical cross-sections at the highest and lowest portions are shown in Fig. 2. The face is inclined at an angle of  $55^{\circ} 10'$ . In each bent, all the members are in compression, with the exception of the members parallel with the face, and also, of course, excepting the anchor rods. The face member is an I-beam (15-inch in the smaller bents and 24-inch in the others); all the other members are built up of angles, Z-bars and plates, as shown in Fig. 2. All the material is of mild steel. Riveted between the bents are  $\frac{3}{8}$ -inch curved face plates, concave to the water, 7 feet  $5\frac{1}{2}$  inches wide over the chord, and having on each side a flat strip  $5\frac{7}{8}$  inches wide, which is riveted to the flange of the I-beam. The radius of the curve is 7 feet  $5\frac{7}{16}$  inches. The plates are 16 feet high. Below the bottom course of curved plates is a course of flat plates, and the open space thus left in each bent is closed by a segmental inclined diaphragm. The vertical joints are double riveted, the face plates lapping each other on the I-beams. The horizontal joints are single riveted, with welt strips on the back. The rivets are  $\frac{3}{4}$ -inch diameter,  $2\frac{1}{2}$  inches pitch.

One of the peculiar features of the construction is that below the  $\frac{3}{8}$ -inch face plating of the steel portion, is a facing of flat  $\frac{3}{16}$ -inch steel plates covering the concrete base. At the bottom this plate is let into a trench sealed with a rich cement mortar. This plating is in courses, 3 feet 6 inches high, put together with  $\frac{3}{8}$ -inch rivets, and stiffened by vertical angle irons at the back, 4 feet apart. The crest of the dam is finished with a fascia plate cut to fit the curved face plates.

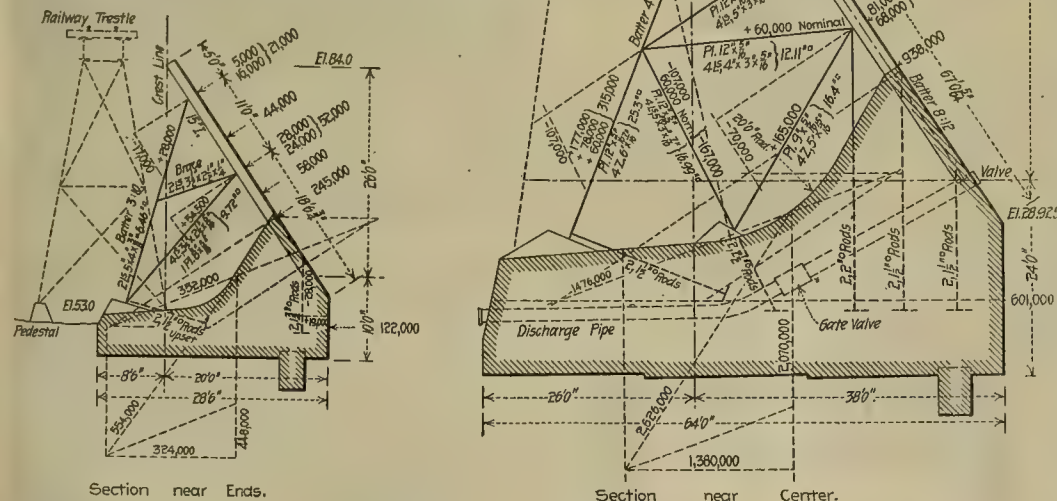

**CONDUITS AND DISCHARGE PIPES.**—Passing through the concrete base of the dam, 20 feet below the crest, are three 24-inch intakes, with cast iron mouthpieces. These are fitted with screens and have bronze sluice gates sliding in guides, and operated from the top of the dam by hand wheels and screws. They are also controlled by 24-inch gate valves, directly accessible in valve pits formed in the concrete. On the west side the intake will connect with a 38-inch riveted steel pipe leading to the Baltic mill, 2200 feet distant. For the purpose of regulating the level of the reservoir four 24-inch discharge pipes are built into the concrete base, as shown in Fig. 2. Like the intakes, these are fitted with a double system of con-

**Fig. 1. Plan and Elevation of Dam.**

base is a steel superstructure consisting of a series of bents or A-frames carrying steel face-plates, and in this respect the dam is similar to the steel dam built for the Atchison, Topeka & Santa Fe Railway, at Ash Fork, Ariz. The most important difference in the design of the two dams lies in the use of a concrete base in the Redridge dam. In the Ash Fork dam concrete is used merely to effect a watertight joint at the heel, the steel structure being anchored directly to the rock in a canyon, and relying upon its anchorage to resist overturning or sliding. In the Redridge dam, however, the natural formation was not so favorable to such a construction, and it was decided to use a concrete base of such dimensions as to constitute a gravity dam. To this base the steel structure is anchored. The proportions are such that at any section of the dam the resultant of all pressures (when the water is level with the crest of the dam) falls within the middle third of the concrete base. The calculations were made to include sufficient friction to provide against sliding (coefficient of friction, 0.69), but there is a large additional margin

holes in the rock clear across the canyon and forcing them full of cement grout. This line of holes was made about 20 feet above the upstream face of the dam, and parallel with it. The holes were made 2 inches diameter, 10 feet deep, and spaced 7 inches apart. Grout was forced into these holes under an air pressure of ninety pounds per square inch, and

**Fig. 2. Cross-Sections of Dam.**

of safety against sliding movement through the fact that the concrete base is built in a trench 2 to 4 feet deep in the rock.

The dam is 1006 feet long, and the length of the steel portion is 464 feet between the abutments. The maximum height is 74 feet. At either end of the steel dam are earth embankments with masonry core walls, bringing the total length of the dam to the figure above stated.

The reservoir formed by the dam will have an area of 150 acres, and an available storage capacity of 600,000,000 gallons, the intake pipes being placed 20 feet below the crest. The water will be carried by steel conduits to the stamp mills of the Atlantic mine, 1300 feet distant, and the Baltic mine 2200 feet, the estimated daily consumption being about 25,500,000 gallons. A wasteway is provided for flood water, no water being allowed to pass over the crest of the dam.

there was good evidence that the grout did fill and seal openings in the rock adjacent to the holes. After this work was done, the rock floor between the dam and the line of holes will be cleaned and covered with a concrete pavement, and that in turn by a puddle bank.

**CONCRETE BASE.**—The concrete base was at first planned as of approximately rectangular section, but in the adopted section a much better distribution of the material has been effected, the height being very much greater at the upstream face than at the toe, as shown by the strain diagrams in Fig. 2. The sealing wall 4 feet wide and 5 feet deep, is carried below the base of the dam. The dimensions of the section vary at different parts of the dam, according to the depth, the variations in both width and depth being made by off-sets, as shown by the general plan and elevation, Fig. 1. At each end is a concrete abut-

trol: The mouth of each pipe has a sliding gate, with stems carried by brackets riveted to the face plates and operated by hand wheels and screws above the crest; each pipe has also a 24-inch gate valve, set in a valve pit formed in the concrete, so that the valves are readily accessible for repairs.

**WASTEWAY AND SPILLWAY.**—As already stated, the dam is not intended to act as a weir, but through the hill on the west of the dam an excavation has been made for a wasteway. The mouth of this is 30 feet long, tapering from 50 feet to 30 feet in width, and having a concrete head wall whose sill is 6 feet below the level of the crest of the dam. Upon this will be steel standards carrying flashboards, which will ordinarily retain the water at full level, but can be removed in time of flood. From the concrete wall extends a timber flume 30 feet wide and 4 feet deep, for a length of 400 feet discharging over the bank of the river. The combined capacity of the flume and the discharge pipes is more than sufficient to dispose of the heaviest flood yet known.

A peculiar feature of the construction of this flume is the provision made for renewing the wearing surface. Longitudinal cedar sills are embedded in the sandy soil, and covered with a flooring of 3-inch pine planks on cross joists. The sides are of similar planks, spiked to stanchions supported by braces. Upon this planking are laid three thicknesses of tarred felt, the sheets extending unbroken from the top of one side to the top of the other side, and breaking joints. This is covered with two courses of 1-inch pine sheathing, the outer one of which can be renewed or repaired without disturbing the water-proofing construction. Triangular timbers are laid in the corners.

**ENGINEERS AND CONTRACTORS.**—The entire dam and its appurtenances are being constructed under the direction of Foster Crowell, M. Am. Soc. C. E. of New York, who is consulting engineer for the hydraulic works of the mining companies, and all plans and specifications were prepared or approved by him. Absence of durable building stone in this region, and the possession by the Atlantic Mining Co. of very excellent rock and sand for concrete, led to the selection of the latter materials in connection with steel for the main dam and concrete core walls with earth embankments for the wings. So far as the steel and concrete combination is concerned, the proposition to adopt a dam of this type originated with J. F. Jackson, Assoc. M. Am. Soc. C. E. of Houghton, Mich., who is resident engineer for the Wisconsin Bridge & Iron Co. It was evident, as stated above, that the dam could not be anchored directly into the rock, as had been done at the Ash Fork dam. The idea of combining a concrete base and a steel superstructure so as to form a gravity dam then occurred to Mr. Jackson, who proceeded to work out forms and sections for heights varying from 28 feet to 74 feet, as included in the main portion of the dam.—Engineering News.

#### McCormick Turbines Operating Electrical Machinery on Comstock Mines.

The accompanying illustration shows a pair of 27-inch McCormick turbines mounted in an iron case on horizontal shaft direct connected to a generator. They develop 1400 H. P. with 400 revolutions when operating under 84-foot head. The variations in load are taken up by a Ludlow relief valve working in

connection with a Lombard water wheel governor. Two 15-inch McCormick turbines in iron cases on horizontal shafts are direct connected to the exciters. Two of these settings complete were built by the S. Morgan Smith Co., of York, Pa., for the Truckee River General Electric Co., Floriston, Cal. The power is transmitted 35 miles to the Comstock mines, where it is used for pumping, hoisting, mine lighting and operating the mills.

Those interested in the development of water power are requested to write the S. Morgan Smith Co. for catalogue of the McCormick turbine.

THE first test of a new system of electric traction by high tension alternating currents on the Lake Como road, in the Italian Alps, is reported as having surpassed the expectations of the installing engineers. A correspondent of the Electrical Review who saw the system tried says a speed of 75 miles an hour was secured without any serious jarring and

that trains of five cars were easily transported at this speed even on decided grades. The dynamos work perfectly at 21,000 volts on a line 67 miles in length. This new method of electric traction is what is known as the high tension polyphase system.

#### Century Traveling Belt Conveyor.

A traveling belt conveyor is a device that finds useful application in connection with reduction works and metallurgical processes, being operated without

the aid of tripping contrivances to discharge its load at any desired point on the line of discharge.

The illustration herewith shows such a conveyor as made by the Jeffrey Manufacturing Co. of Columbus, Ohio. It consists of their "Century" type of rubber belt with troughing rolls, the whole affair, together with the electric motor that drives it, being mounted upon truck wheels which run on tracks over the line of discharge. The conveyor illustrated is installed in a cyanide mill for the reduction of gold ores, and delivers the crushed material to a line of vats, depositing it anywhere along the line, according to the position in which the conveyor is placed. The conveyor is supplied with ore at a point near the center of the line of vats, and is but one-half as long as a stationary conveyor would be with a tripping carriage, as it carries either to the right or left, the motor being a reversible one to admit of the change.

In some cases, where the conveyor is a long and heavy one, the truck is made self-propelling, being driven along to the desired location by the same motor that drives the belt. Connection with the motor is provided by a flexible cable or an ordinary trolley line.

#### A New Short Beam Balance.

An assay button balance with a 4-inch beam, herewith illustrated, has lately been put on the market by Wm. Ainsworth & Sons of Denver, Colo. They claim for it that with other improvements it may be operated faster and that it swings quicker than other balances. The base is extended on either side so as to include the pan rest bearings, thus insuring their perfect alignment, together with that of the center rod, and by removing the rider bar support screw and the two base screws the entire upper works may be removed for cleaning. An improved rider apparatus is provided, the slides being cushioned and German silver springs provided which take up all wear. The balance has a 4-inch beam, divided

into fifty parts each side of the center, and, being unobstructed on the top, the rider may be placed at any point from zero at the center to the last division at either end, which is directly over the end edge and represents the full weight of the rider used. Special reading glasses are provided for the beam and index, all bearings and edges are of agate, and it has fall-away pan rests and plate glass sub-base.

#### System of Zinc Ore Buying in Missouri.

In the purchasing of zinc ores it should be understood that blende, or "jack," as it is commonly termed, is based upon an average assay value of 6% zinc and an allowance of 1% iron which is not penalized. For each per cent of zinc below 60% \$1 per ton is deducted from the market price. For each per cent of iron greater than 1% a deduction of \$1 per ton is made. For each per cent of lead in a ton of ore 50 cents per ton is also deducted. For each per cent above 60% \$1 is added to the basic price. For example, a shipment of ore may assay as follows: Jack 58%, iron 2%, lead 1%. At \$25 per ton for 60% stuff, this shipment would be penalized \$1 for each per cent of zinc below 60, or \$2. As the ore carries 1% more iron than the 1% which is not penalized, another deduction of \$1 must be made. Of lead the ore carries 1%, enforcing another deduction of 50 cents, making a total deduction of \$3.50, and the net purchase price of the shipment \$21.50. Should the ore assay 62%, as is so far the case with most of the sample lots of Arkansas ores, and there be little iron in the stuff, then the 2% in excess of the basic value would add \$2 to the purchase price, making it \$27.

In order to arrive at the assay value of the ore, an excellent system of sampling has been reached, after years of experience, by the ore buyers and the mine operators. A few shovelfuls of the moist jig stuff is taken from the car after it is loaded and the stuff carefully mixed together and quartered down to samples from one to five pounds in weight in the presence of both the ore buyer and seller. Each takes one part of the sample and the third is held for an umpire assay in the event that there should be a dispute between the buyer and seller over the assay value, or for use in case of accident. Each party to the sale has his sample assayed, and unless there be a variance in the returns of more than a few tenths of 1% the average of the certified results is accepted by both as the basis of settlement.

The determination of the amount of moisture in the stuff is made in the usual manner. Jig stuff ready for shipment varies from 1% to 4%, according to the quantity of fine concentrates it contains. Buddle, or sludge headings, when fresh, carry from 10% to 12% and fine sludge concentrates from 12% to 17%.

Carbonates (or dry bone) are sold at an agreed price per ton. They are sold in the Joplin district at from \$10 to \$15 per ton, delivered at the railroad station. Their assay values in the Joplin district range from 40% to 48%. As yet carbonate ores are not sold upon an assay value. Silicates are sold in the same manner as carbonates.

To put the matter as an assayer would put it, ore is bought according to a price found by the following formula:  $WQ - (E + P)$  where  $W$  = weight of zinc, in pounds, contained in a ton of ore, as found by assay;  $Q$  = St. Louis quotation in cents per pound;  $E$  = total charges (freight, commission and treatment charges), usually fixed at \$10.50 per ton;  $P$  = smelters' outfit =  $100Q$  when ore assays 60% or over. In addition, deductions are made from this price of 50 cents for each per cent of lead and \$1 for every unit of iron in excess of 1%. Then an ore carrying 60% zinc, 1% lead, 2% iron, spelter quoted at 4 cents would bring  $1200 \times 4 - (10.5 + 4 \times 100) = 48.00 - 14.50 = \$33.50$ . From this deduct \$1 for iron and 50 cents for lead, or \$1.50; net price, \$32 per ton.—The Lead and Zinc News.

A TREASURY STATEMENT recently issued gives details regarding the imports of gold at Pacific coast ports which are of more than ordinary interest. According to the statistics the receipts of gold at San Francisco and the Puget sound and Alaskan ports during the year ending June 30, 1901, amounted to \$45,923,289. It is to be observed that the gold output of the Klondike and other districts in the Canadian northwest is treated in the same way as Australian or other foreign specie. The figures show that in the year \$23,704,493 of gold came from Australia and the Orient to the Pacific cities of the Union, while the Klondike gold they received amounted to \$21,318,796, making a total of \$45,023,289, as compared with \$23,117,050 in the previous year. This large increase is made up of gains of \$14,438,562 in the Australian and \$8,367,077 in the Klondike gold.

THE Division of Soils of the United States Department of Agriculture has just described a new instrument now in use for investigating the properties of soils. This is a great time and labor saving apparatus, giving accurate and reliable results, which otherwise would require months to obtain. The new apparatus as devised by the Division of Soils is an electric affair. It registers a half dozen or more various soil properties. This method depends upon the principle that the resistance offered to the passage of an electric current from one carbon plate to another buried in the soil depends upon the amount of moisture present between the carbon plates or electrodes.

## Mining and Metallurgical Patents.

Patents Issued August 20, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ELECTRIC FURNACE.—No. 681,107; A. H. Cowles, Cleveland, Ohio.

An electric furnace, furnace-chamber walls of which are composed of carbon permeable to vapors and gases, a cooling jacket outside of walls, and means for electrically connecting jacket with exterior of walls to form condensing space or chamber between jacket and walls.

CONCENTRATOR.—No. 680,938; A. B. Paul, San Francisco, Cal.

A longitudinally movable table having inclined bottom, closed sides and lower end, with one or more chambers located at lower end having controlled discharge opening and slots opening into lower part transversely of line of movement of table, plates above slots, extending from sides of chamber to sides of table, a frame composed of longitudinal side timbers between which table is suspended, plates projecting from table above frame timbers having contact surfaces formed upon front ends, elastic buffers fixed upon frame timbers in line of movement of plates and means for retracting table and moving it suddenly forward, so that it will produce a concussive movement between contact plates and buffers.

HYDRAULIC AIR COMPRESSOR.—No. 680,951; A. G. Waterhouse, Springfield township, Pa.

A series of two or more air compressors, each separate compressor having a stand-pipe, through which water has an unobstructed flow, from its head down to lowest level below that of its tail-race and into a well or passage, leading up to its tail-race; each stand-pipe is provided at its upper extreme, with means for causing descending water to draw in air and carry same down with it, and, at its lower extreme, with an air collector, for separating air from water, each compressor having an air-pipe,

leading from its air collector to stand-pipe of another compressor, at lowest level at which air will enter, all being constructed in the order whereby air from compressor having least compressing force will have its compressed air conducted to stand-pipe of another compressor, having next higher compressing force, from where its air, together with air from first compressor, will be conducted to a third compressor, and so on, until air collected by compressors is conducted to a final one, where it is further compressed and conducted for use.

ROCK DRILL.—No. 681,011; O. G. Worsley, Newark, Ill.

A chambered stock having a lateral aperture, a cutter housed within chamber and projecting through aperture, and having a bearing against top wall of aperture, against wall of stock opposite aperture and against wall of stock below aperture.

DRILL.—No. 681,035; T. P. Blake, Lamar, Nev.

A hollow body forming a bucket, a bit or bits at lower end, sleeve carried rigidly on top of body and formed with internal thread at base of which is lug spaced therefrom, sleeve also having interior switch-rib, and plunger working vertically in sleeve and provided with lug adapted to ride on thread within sleeve and to engage rib or lug at base, switch rib serving to turn plunger on its upward movement to recover its engagement with thread.

ROTARY PUMP.—No. 680,722; M. Mauran, Niagara Falls, N. Y.

An earthenware chamber consisting of detachable

sections, a rotary shaft entering chamber and provided with enlarged end or head, a non-corrodible sleeve carried by shaft, a packing device surrounding sleeve, an earthenware disk provided with wings and secured to face of shaft head, and a layer of protective material extending from sleeve to disk and protecting shaft head.

AMALGAMATOR.—No. 681,034; A. R. Black, near Lamar, Colo.

A tub and separated stationary amalgamated plates therein, amalgamated plates located between stationary plates and adapted to rotate between and in relation to them, a perforated feed-pipe movable between stationary plates in pulp in tub, whereby material to be amalgamated is fed to plates under surface of pulp in which feed-pipe moves.

COPPER ALLOY.—No. 680,819; B. S. Summers, Chicago, Ill.

The alloy consisting of approximately one-tenth of 1% of magnesium and commercially pure copper, being capable of being readily cast.

Specimens Received by the California State Mining Bureau, May 1 to July 31, 1901.

Gold quartz, Baliol mine, Sutter Creek, Amador Co., Cal.; W. H. Storms.

Quicksilver ore, peculiar specimen showing infiltration of siliceous solution, Silver Bow mine, Napa Co., Cal.; B. M. Newcomb.

Ruby silver, pyrrargyrite crystallized specimens, gold quartz and auriferous calcite, Great Barrier island, New Zealand; Albion S. Howe.

Lepidomelane, Isabella, Kern Co., Cal.; M. G. Mendoza.

Quicksilver ore, Ygnacio mine, San Benito Co., Cal.; F. C. Mathyas.

Roofing slate, Eureka quarry, El Dorado Co., Cal.; G. S. Estey.

Barite, Baxter tunnel, Copper City, Shasta Co., Cal.

Loadstone, 1½ miles from Baird's, Shasta Co., Cal. Gaylussite, Mono Lake, Cal.; S. Soderling.

Phthanite, Trinity Co., Cal.

Quartzite, near Spenceville, Nevada Co., Cal.

Pyrrhotite, Black Diamond mine, Shasta Co., Cal.

Gold quartz, Allee mine, Scott Valley, Siskiyou Co., Cal.; W. Dyer.

Silver ore, Santa Ana mine, Pinos Altos, Chihuahua, Mexico; F. M. Lyle.

Porcelain jasper, slope of Mt. Shasta at 12,000 feet elevation; H. E. Josselyn.

Sphalerite, Afterthought mine, Copper City, Shasta Co., Cal.

Native mercury in cinnabar, Socrates mine, Pine Flat, Sonoma Co., Cal.; Dr. C. F. Burgess.

Native mercury in cinnabar and rich cinnabar extracted July 23, 1891, from the Marfa and Mariposa mines, Terlingua, Texas; Montroyd Sharpe.

Rich silver ore carrying gold, Tonopah, Nye Co., Nev.; H. Wadsworth.

Muscovite (amber mica), Custer City, South Dakota; Denis Henault.

Malachite, White Rock mines, Mariposa Co., Cal.

Redingtonite and knoxvillite, two very rare chromium minerals, Redington quicksilver mine Napa Co., Cal.; B. M. Newcomb.

Copper ore, melaconite, chrysocolla and azurite, California &amp; Nevada Copper Co.'s mine, Yerington, Lyon Co., Nev.; David M. Coney, Pres.

Forty-two exhibits of copper ores from California, from new locations principally.

H. S. DURDEN, Curator.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### KETCHIKAN.

The Sea Level mine, at Sea Level, Ketchikan district, has let the contract for the iron work of a 30-stamp water power mill and a contract for 200,000 feet of lumber for the building construction. E. C. Morse is Supt.

### RAMPART.

Reports from Dawson state that very rich strikes have been made in the vicinity of Rampart. A big stampede to that place followed. On all the properties opened nothing less than \$1 to the shovel had been washed out. Bedrock is only 8 feet below the surface. The strike is 30 miles from Rampart by the overland route, on Glenn gulch opening into the Tanana river, 70 miles from the mouth of the Tanana. While the discovery seems to be a very rich one, it is not very extensive. Good reports are brought regarding Faith creek, in the upper Tanana placer fields, but nothing big has developed there.

### VALDES.

Valdes has been almost deserted during the summer, nearly every one being in the interior or out in Prince William Sound prospecting for copper. Very rich discoveries of high-grade copper are being made, and the district recorder and clerks have been kept busy recording location notices. Copper locations have been salable. Among the mines now in operation are those of J. D. Menach, the Gladhaugh property, the Williams mines, owned by L. L. Williams of Juneau, and the mine of the Prince William Sound M. & D. Co., of which G. M. Esterly of Washington, D. C., is the head. R. Blei of New York City, representing New York capitalists, has bought a number of claims and has several men in the Tanana country prospecting and a larger number of men prospecting in the islands of Prince William Sound.

## ARIZONA.

### GILA COUNTY.

The Grand Prize M. Co. of Arizona is operating the Grand Prize mine, near Pine, in the Mogollon mountains. The ore at the surface, being an iron oxide, carrying large values in gold, was run through a stamp mill. At a depth of about 100 feet very rich copper sulphide ore was struck. The gold values are very high. Over 5000 feet of development has been done on the mine, the deepest shaft being down about 265 feet. About forty men are employed at the mine. A 100-ton smelter has been installed, which it is intended to blow in about September 1.

### GRAHAM COUNTY.

J. Garten, J. Sanford and H. Wormick while panning the sand in Kilbery canyon discovered a rich gold-bearing ledge with hanging wall of quartzite and foot wall of porphyry. They located two claims on the main lead and two on a smaller one. Sanford and Wormick have sold their interests to E. Randolph and F. B. Hartman of Tucson.

### MARICOPA COUNTY.

The Copper Belle or Gleason mine at Gleason is employing a large number of men and is yielding a good grade of ore. Some of it is being roasted at the mine before shipment to the smelter, and the rest is being shipped unroasted. The work on the smelter is being pushed with vigor and it is expected to be ready to blow in very soon.

J. L. Wetmore, Supt. of the Colony mines, in the Sierritas, says a mill of two tons capacity and a concentrator handle the ores taken from the mines. The dry crushing process is used. The works have closed down, as the rains have so saturated the ore that it cannot be successfully treated.

### MOHAVE COUNTY.

The Weldon M. Co., a Michigan corporation, J. Gamble, Jr., manager, is developing a gold and silver mine situated in the Quijotoa. A 10-stamp mill has been contracted for, which is expected to be in operation before winter.

### SANTA CRUZ COUNTY.

J. W. Thomas of Phoenix, president of the Buena Vista M. & M. Co., says there are eleven claims in the mine his company bought at Patagonia from M. Maloney, and development shows ore carrying copper, silver and gold in paying quantities. The Buena Vista Co. has been recently organized. J. W. Thomas is president, J. A. Elliott secretary and treasurer and F. Cox general manager. The mining force will be increased and concentrators will be put up at the mine to prepare a high-grade shipping concentrate.

## YAVAPAI COUNTY.

The Union or Luke gold mine, in the Bradshaws, 42 miles southeast of Prescott, is being developed. E. Metcalf of Phoenix is Supt. The new owners of the mine have incorporated, with W. J. Rainey president and H. A. Eastman secretary. The offices of the company are in Detroit, Mich.

G. White and H. Minuse are developing the properties of the Brooklyn M. Co. in Agua Fria district. There is a 127-foot shaft on the property. The ledge is from 3 to 4 feet wide, the pay streak 2 feet wide. The ore is free milling and is said to carry \$20 per ton in gold.

## CALIFORNIA.

California has furnished nearly all the quicksilver produced in the United States. Mining for it began before the discovery of gold. The first operations were in 1845, about 15 miles south of San Jose, on the New Almaden mine. There is no record of the product of that mine prior to 1850. For fifteen years or more thereafter it produced at least 90% of the total product of the State. For the past ten years the yield has been comparatively small. From the report of the mine from July, 1850, to December, 1890, prepared by J. B. Randall, for many years the manager, it appears that from July, 1850, to June, 1858, the annual yield varied from 18,035 flasks in 1852-53 to 31,860 flasks in 1854-55. In the years of 1864 and 1865 the yield of that mine was the largest in its history—42,489 flasks and 47,194 flasks respectively. The total yield of the New Almaden mine from 1850 to 1890—a period of thirty-seven years and three months of active work—was 905,888 flasks of 76½ pounds each. The quantity of ore roasted in securing this yield was 1,308,089,440 pounds. The percentage of quicksilver up to 1865 varied from 36.74 in 1850 to 10 in 1865. There was a further falling off in percentage after 1865, the lowest being 1.69 in 1886. About 500 men were employed in the most active part of the mine's history. From January, 1864, to December 31, 1890, the amount of drifting and sinking in the mine was equal to 47.82 miles, at a cost of \$2,131,872. This sum is exclusive of expenses attending the excavations made in extracting ore and other work, while 15 miles more should be added for drifting and sinking prior to 1864. The New Almaden mine has been worked by a New York corporation—the Quicksilver Co.—and has paid \$1,888,411 in dividends on preferred stock to June 1, 1901.

There are now twelve counties in California where quicksilver deposits have been found, as follows: Colusa, Lake, Napa, San Benito, Santa Clara, San Luis Obispo, Sonoma, Trinity, Monterey, Mendocino, Humboldt and Siskiyou. Next to Santa Clara, the counties north of San Francisco have been and are still the largest producers. In the last half of the nineteenth century the California quicksilver mines have produced 1,831,022 flasks of quicksilver. The sale price in San Francisco has been as high as \$118.55 and as low as \$25.25 per flask. The present price is \$46 to \$47. Up to the close of 1899 the 1,831,022 flasks produced probably sold for \$88,000,000. In 1887 Oregon was credited with a product of sixty-five flasks. There are a number of deposits there. More recently a deposit of this ore has been found in Nevada, but whether of sufficient value to be worked is not known. In 1899 there was a deposit reported discovered at Terlingua, Texas, which, it is claimed, has yielded about 1000 flasks.

### AMADOR COUNTY.

Sinking is being continued at the Lincoln mine, Sutter Creek, and the shaft is now down about 1500 feet and will be continued to the 2000-foot level.

It is reported to be the intention of the owners of the Oneida mine at Jackson to erect chlorination works at the mine. The Oneida is employing 150 men and its sixty stamps are said to be crushing 300 tons of ore per day, which pays about \$3.50 per ton.

### BUTTE COUNTY.

The Bay Counties Power Co. of San Francisco is preparing to erect another large power plant in Butte county, 20 miles northeast of Oroville, on French creek, a tributary of the North Fork of the Feather river. Surveyors and other workmen, under T. E. Theberath, chief engineer of the company, are at work at the point named. The company has decided to erect at French creek a generating plant even larger, it is reported, than the one at Colgate, on the Yuba river, which is said to be the largest in California. The plans include the construction of a large storage reservoir on French creek, and a mile-long tunnel through the mountains.

### CALAVERAS COUNTY.

The Calaveras mine, at Murphys, is owned by an Eastern company and operated under the superintendency of J. H.

Heard. The company is doing development work in the lower mine levels. It is stated that a large cyanide plant will be built to treat some thousands of tons of the old Calaveras mill tailings.

H. C. Swank has had a mill test made on fifteen tons of ore from the Pajaro mine, near El Dorado, which yielded \$16.32 to the ton. A mill is projected for the property.

### EL DORADO COUNTY.

The Eastern capitalists who have bonded the Zantgraf mine, near Auburn, intend reopening the mine about the middle of September. H. D. Coles, the former owner of the mine, will very likely be Supt.

A copper smelting furnace which Eastern capitalists have constructed at Alabaster cave, Newcastle P. O., has been tested, but on account of defective flues the starting up has been postponed. It is said that the ore runs about \$14 a ton and that it fluxes readily.

### MENDOCINO COUNTY.

A discovery of quicksilver has been made on Hardin's ranch, near Cahto. The surface croppings and ledge were discovered by J. H. Babcock, a prospector, to whom Hardin has agreed to give a half interest in the mine and immediately develop it. C. Singleton and R. Agnew from Trinity county are arranging for the placing of machinery and a furnace, and from twenty-five to forty men are expected to be employed within the next month.

Rich quicksilver indications have been found on the Harrington ranch, near Cahto.

### NEVADA COUNTY.

The mill and hoisting works of the Rose Hill mine at Nevada City were burned down, the cause of the fire being unknown. R. D. Lawrey is the owner. The mine was not being operated.

### PLACER COUNTY.

(Special Correspondence).—The Turkey Hill drift mine at Michigan Bluff is being operated by the Boston-South Dakota M. Co., J. Calderwood general manager. About eighty men are being worked. The old workings are being cleaned out and some rich gravel is being taken out. A complete map is being made of the complicated underground workings. At the Caledonia quartz mine on Horse-shoe bar a local company, with W. Stuart as Supt., is extending the tunnel 130 feet to cut the shoot. G. Macauley has twenty-five men at work on the Horse-shoe Bar placer mine. The hydraulic elevator plant is being moved to new ground that prospects well.

### Michigan Bluff, Aug. 23.

The Tadpole Con. M. Co., operating near Canada Hill, above Westville, has its tunnel in 55 feet and has found 3 feet of gravel that prospects.

A report from the Bob Lewis No. 2 gravel mine of Westville states that the new main tunnel is being driven in at the rate of 49 feet per week. The company expect to strike gravel in about 1200 feet.

The Bonnie Bee Quartz M. & D. Co. at Blue Canyon expect to install a compressor and run the development tunnels by means of power drills.

### SAN DIEGO COUNTY.

The Hodges Bros. of Yuma, Arizona, and Hedges have bonded a group of eight claims at Hedges to G. H. Barker of Pasadena, Los Angeles county, Cal., for \$75,000, and another group of six claims for \$6000. Development work is being done under charge of G. A. Trumbou and W. B. Hodges. Four shafts are down over 100 feet each, with the ore body improving with depth. In tunneling on the property it is claimed a rich ledge was found.

### SHASTA COUNTY.

The Shasta May Blossom Copper Co., an incorporation recently formed and consisting principally of members of the Granite Creek S. & R. Co. of Boston, has taken a short-term bond on the Kiehl group of copper claims near DeLamar. M. Lindley of Sacramento represents the Boston people.

A six months' bond at \$10,000 has been taken on the Alta group of ten quartz claims located near Kennett. Mrs. J. Wilson owns the Alta group and the bond was taken by J. M. Patterson and D. Reese of Yreka.

M. Russell and W. McTarnahan of Shasta have commenced development work on their mine, known as the Extension, on South Fork.

J. M. Hart and R. Small have bonded for one year at \$5000 the Mullen and Poor Man quartz mines, at Shasta, from J. M. Pfeifer, who is to receive 10% of the net smelter returns on the rock pending purchase.

The Lowdon and Friday copper claims in the Backbone district, near Kennett, have been bonded to the Trinity Copper Co. for one year. The ground consists of

about 200 acres of copper claims and patented ground. The property is owned by J. Lowdon and W. Friday of Redding.

### SIERRA COUNTY.

M. Rohrig & Sons have taken out a pocket of about \$5000 at the claim they are working near Alleghany. Mr. Rohrig is reported as intending to put a mill on the mine early next spring.

### SISKIYOU COUNTY.

The Oregon & California M. & M. Co. of Ashland, Or., have sold their mine, located near Henley, for \$10,000 to H. B. Kelly of Wyoming, G. B. Goodell of Portland, Or., and C. W. Tyrer of Colorado, who have been operating the mine under a bond for several months. The property sold includes a 5-stamp mill. The mine has had development work done upon it to the extent of 500 feet of tunnels and 350 feet of shaft, and the new owners now intend, it is reported, to work the mine extensively.

The McKeag quartz mine on Boulder creek, near Callahans, is said to be prospecting well. The ledge is from 2 to 3 feet in width, and easy to work, the quartz being run through a rock breaker and then put directly into cyanide tanks, the quartz being broken up to ¾-inch mesh. The cyanide process is said to make a good recovery of value.

At Henley, work in the mines has been started again, by putting on more men at the Jillson and LeFlesh mines. Mattern & Co. also have a force at work, and other companies are starting operations in the vicinity of Hornbrook and Henley.

The long tunnel under Cherry Hill mountain, near Yreka, which has been started by the Cherry Hill G. M. Co., will cut four known veins, and should develop the blind ones from which rich float rock came. An air compressor, engine, boiler and power drill are to be installed. The tunnel is to be 1500 feet long, but is expected to be finished inside of six months. Meanwhile the company is operating the mill from the ore bodies higher up on the mountain. It is stated that a ten-days' run in August gave nearly 400 ounces of amalgam, or about \$200 per day mill returns.

### SONOMA COUNTY.

The Carr Realty Co. of San Francisco has begun suit asking that it be adjudged owner of the Socrates quicksilver mine, located near Cloverdale. The claim is based upon the alleged transfer of the rights of the heirs of the late W. D. Carr, who was one of the fifteen original discoverers of the property in 1860. The title is in dispute between some twenty or thirty claimants.

### TRINITY COUNTY.

The Golden Jubilee mine at Trinity Center, J. C. Steele Supt., is running steadily. The ledge is 60 feet wide and averages from \$8 up a ton. The mine is equipped with a sixty-ton cyanide plant and two Huntington mills.

At the Brown Bear mine at Deadwood the upper levels, being supposed to be worked out, a new tunnel was run over 5000 feet to open the mine at greater depth, and the mill was rebuilt at the entrance to the new tunnel. No ore has been struck in this tunnel and preparations were being made to close the mine down. The discovery of new ground in the upper works has postponed this indefinitely. A small seam being followed on the Lambert vein widened to 4 feet, and raising on it widened out to 14 feet of high-grade ore, which is being drifted on in both directions. A good body of ore has been found sinking from the China tunnel.

H. W. Postlethwaite and S. F. Loughborough of San Francisco are prospecting for dredger ground in Hay Fork with a driller. This enterprise has been incorrectly stated as being undertaken by the Risdon Iron Works Co. of San Francisco.

### TUOLUMNE COUNTY.

The Gagnere mine and mill site, near Tuttle town, have been sold to Pennsylvania parties for, it is reported, about \$37,000.

The Mt. Hood M. Co. has bought the steam hoist formerly used on the Manhattan mine, Stent, by the High Point Co., and will set it up on their property at once.

The Riverside mine, near Jamestown, will resume operations about Sept. 1, under the management of H. H. Martin, who, with others, has bonded the property.

The Clio mine at Jacksonville has been bonded to the company formerly exploiting the Bown mine at Tuttle town, the price being, it is said, \$275,000. W. J. Rule will be Supt.

Supt. J. Hamilton of the Jubilee mine, near Sonora, reports that a new shaft has been started and is now down about 60 feet. The test mill run of twenty-five tons, recently completed, yielded \$1400.

The tunnel on the Contention mine, near Columbia, is being extended and an

upraise to surface is being cut 180 feet in. Ore is being stoped and sent to mill for a test run. The property is owned by a corporation, but is being operated by L. M. Howe under a bond at \$11,000.

It is stated that the Keltz mine, near Columbia, will be started up soon. The Keltz was worked continuously for eight or nine years, and yielded considerable gold. The mine is equipped with a 20-stamp mill.

The new mill at the Golden West mine is running steadily. Supt. Restano states that preparations are being made to run the hoist and mill by water power. The water will first be used at the hoist and from there be piped to the mill and used a second time.

The Sunset, a new mine discovered in the vicinity of the Contention mine, near Columbia, is being worked by G. Miner. In a shaft recently commenced a vein 18 inches in thickness prospects well.

#### YUBA COUNTY.

J. H. Ryan, of the Union Mutual M. & Dev. Co. of San Francisco, and F. E. Wright, state that their company, under Mr. Wright, has been engaged four months past in prospecting and locating claims for the company in Yuba county. The company have secured locations on a large lode and intend to construct a mill and oxidizing plant a short distance west of Bullards Bar, taking water from Oregon creek.

#### COLORADO.

(Special Correspondence).—A party of gentlemen, including many members of the American Geological Society, left Denver on Aug. 16, visiting first the saurian beds and "fish graves" along the Arkansas river, near Canyon City, and going thence to the upper Arkansas and Eagle river to view the glaciation of that locality. Some time was also spent on Aspen mountain, in Pitkin county. The trip was continued, via Grand Junction, to Ouray, where the party was conducted by T. F. Walsh, through his Camp Bird mine and mill in Imogene Basin. The journey was continued over the pass to Savage basin, thence to Telluride, where visits were made to several noted mines. On August 23 the party went to Silverton, a number of its members crossing the ranges on horseback via Red mountain.

At Silverton the party visited the Silver Lake mines under the guidance of Manager S. I. Hallett.

Those composing the party were Professors Emmons, Van Hise, Colvin of Iowa, Eastman of Harvard, Fairchild of Rochester, Grant of Evanston, Chamberlin of Chicago, A. N. Winchell of Butte, J. C. Branner and Newsome of Leland Stanford University, Cal.; J. W. Finch, Colorado State Geologist; Prof. Patton of Colorado State School of Mines; Prof. Lakes of Denver, and Messrs. Bagge of Colorado Springs, George L. Cannon of Denver, Bain of Idaho Springs, C. Hersey of Leadville and V. G. Hills of Cripple Creek. The party returned to Denver to attend the meeting of the American Association for the Advancement of Science.

#### BOULDER COUNTY.

The shaft on the Enterprise at Eldora is down 423 feet and a station has been cut at this point. The property will commence shipping at once. C. Shahan has been succeeded as Supt. by T. L. Lamars, M. E., of Denver.

The Lucky Star, at Wall Street, owned by L. A. Duncan, C. Wise and C. Cheney of Boulder, has struck ore which, unsorted, is shipping ten ounces to the ton by the carload.

The Little Giant, at Wall Street, has resumed sinking and is now down 60 feet. The vein is 7 inches wide and is running \$30 to the ton. The owner of the Giant is the Ramona M. Co., G. E. Brown of Woburn, Mass., being managing director.

The Concord tunnel is being steadily driven. It is in 400 feet and producing ore. The vein is 2 feet wide and assays from \$6 to \$225 per ton. The owners are P. J. Werley and F. Eldridge.

The Wood Mountain M. Co. have completed the improvements for mill and increased mining at Wall Street. They have put in a hydraulic power plant. A 24-inch steel pipe line has been laid for 2300 feet, and water wheel and compressor erected. The company has completed a series of explorations with diamond drill, and the results of their boring are considered satisfactory. They will have from 100 to 150 H. P. to drive the machinery.

#### CLEAR CREEK COUNTY.

Missouri and Boulder people are interested in the Wizard G. M. Co., which is operating near Central City, with Farnsworth Bros. in charge. The company has twelve claims under development through a tunnel under construction. Farnsworth Bros. report that the tunnel has cut four leads.

The Heddensberg mine, near Idaho Springs, which has been closed down for a long period, is about to be started up again. The company will sink a shaft to

connect with their tunnel, which is in nearly 500 feet.

F. J. Alexander says work is going on uninterruptedly on the Specie Payment mine at Idaho Springs. The weekly shipments amount to twenty-five tons of smelting ore averaging \$85 a ton and fifty to seventy-five tons of milling ore worth \$7 a ton. The deepest workings are 500 feet and drifts on the vein show the latter to be from 3 to 25 feet wide. The property is to be equipped with electric drills.

At the Sleepy Hollow mine, near Black Hawk, the Sleepy Hollow M. Co. expect to begin development work, which includes the sinking of the shaft, now 900 feet deep. It is reported that J. Carls will have charge of the underground work.

#### DOLORES COUNTY.

W. A. Miller has sold his one-half interest in the River View tunnel and mine at Rico to D. Swickhelmer. It is understood that the Southern M. & M. Co. are the real buyers and will eventually take the mine. The Southern now practically controls the Kearney and Ninety-eight claims, worked through the River View tunnel; and with this last buy they will own a controlling share of the entire ground and properties on that portion of C. H. C. hill.

#### FREMONT COUNTY.

(Special Correspondence).—The Rocky Mountain smelter is closed down, pending the putting in of roasters to desulphurize certain grades of pyritic ore which comes from camps other than Cripple Creek. A large and well-equipped refinery is also being erected, which will have all the up-to-date features. F. W. Draper of McGill University, Montreal, Canada, is superintending the construction of the refinery. Florence, Aug. 23.

#### GILPIN COUNTY.

Denver parties are interested in the Monitor tunnel property on Dory hill, near Black Hawk, under the management of G. F. Lewis of Denver. The tunnel has been driven 175 feet, showing a streak of lead ore averaging from 4 to 8 inches in width.

The Mida M. & M. Co. has been incorporated, capital \$50,000, with A. M. Berry, Denver, president, and E. C. Miles, Black Hawk, secretary and treasurer. It has been organized to work the Russell Hill mine, which has been developed by a tunnel from which an incline shaft is to be sunk on the vein. Ore shipped has given values as \$58 per ton. The company will commence development work at once.

The Electric Spark M. Co. has commenced work on the Grace Darling property, in Lake district, near Central City, and is sinking a new shaft at 25 feet depth. A 2-foot vein has been cut which assays well. The company will sink 75 feet at once and will build a 20x40 shaft building for a gasoline hoisting plant, which will be placed on the mine soon. This property has not been worked for a number of years. Omaha capitalists are operating this mine with J. A. Yawger as manager.

At the Senator mine, near Black Hawk, the 22x50 addition to the shaft building has been completed. Drifting is being done in the 200-foot east level. G. W. Schneider of Central City is manager for A. Radel of Bridgeport, Conn., and J. Steiner of Denver, who have a lease and bond on the property.

The Hillhouse M. Co. at Central City, Simonds manager, is installing a gasoline hoisting engine plant on the Hamlet shaft, on which a new building has just been completed. The shaft on this property has not been worked for many years, but is down 455 feet.

#### GUNNISON COUNTY.

F. J. Mott of Denver has begun to operate the Independence property at Gunnison. A good vein of silver-lead ore is showing in the main shaft.—Pennington Bros. of Gunnison are operating a mine on Ruby peak.—The Ruby Chief mine, operated by the California-Colorado Shareholding M. & M. Co., is to soon resume operations.

#### HINSDALE COUNTY.

The tramway and concentrating mill construction at Lake City for the Hanna M. & M. Co. will be commenced at once. Mr. Dewey, formerly of the Hidden Treasure mine at that place, will be Supt. The tramway will be about 4700 feet long, and will cross over the surface of the Mineral Farm group of mines. The mill will be built on plans made by Mr. Dewey, and will have an initial capacity of fifty tons per day.

#### HUERFANO COUNTY.

G. H. Utter, geologist, has been examining the country along the copper belt near La Veta for Eastern people.

R. Deeds of La Veta has relocated an old property and, backed by a company at Elgin, Ill., expects to do considerable work on it.

#### LAKE COUNTY.

Sheedy & Kountze of Denver, who are at the head of the Nubian M. Co., which is opening up a claim at Leadville, have, in addition to a fine iron and lead ore chute, a fine streak of hard carbonate, which is very rich in chloride. Considerable of the ore has been shipped. The streak is not very wide, but runs from 1000 to 2000 ounces silver to the ton.

At the Hoffer shaft of the Big Evans M. Co., which is to be extended to the lower levels, a large plant of new hoisting machinery is to be installed. The shaft is being sunk for a high-grade ore body discovered by diamond drill prospecting below the present levels.

At the White Cap, Leadville, where new prospecting work is being carried on, J. Shinn is manager for Eastern people. At a depth of 700 feet a drift is now being run to open up the sulphide ore zone.

#### MINERAL COUNTY.

(Special Correspondence).—The Ridge mine has been worked for the last three years under lease to A. E. Reynolds of Denver; Geo. N. Nichols of Del Norte, Colo., is the principal owner. The aforesaid lease expires Dec. 25, 1901, and it is presumed the closing down of the mine last week was due to the fact that the lessee did not care to go on with needed development without assurances of renewal of lease. The Ridge has been a producer for the past ten years, and during recent years has shipped an average of 200 tons of concentrates per month. Those shipped within the last three months are said to have run 80% lead and three to five ounces silver. The mine is opened through a 500-foot tunnel, a 500-foot shaft sinking on the vein from near the breast of the tunnel. Drifts in ore have been run on five levels; continuous production requires new development work.

The Solomon, Ethel and Moses are operated under one management. Most of the product of the three is concentrated at the Ethel mill, of which J. A. Smith is Supt. The monthly output of this mill is about 150 tons of lead concentrate and 225 tons of zinc concentrate. The interesting feature of the work is the successful separation effected of the lead from the zinc. The work is done by Hartz jigs, sizers devised by Supt. Smith, and Willey tables. The sizer product consists of flour lead and flour zinc, which go to the table for separation. The heavy, coarse lead is a jig product; the zinc, which is of lesser specific gravity, passes from the jigs to the sizers, the latter having a sixty-mesh screen that catches the flour-fine zinc and lead. The four jigs run forty-five to fifty tons per twenty-four hours. These mines furnish at least five grades of ore, the difference being mainly a matter of specific gravity, quantity of iron, silica, lime and spar. The elimination of the lime appears to be one of the difficult features of the work. The zinc concentrate, which averages about 55%, is shipped to Joplin, Mo.; the lead concentrate will average about 75% Pb.

Creede, Aug. 17.

Z. Wilson, lessee on the Kentucky Belle, near Creede, is shipping fifteen to twenty tons of ore per month that runs well in bromide of silver.

#### OURAY COUNTY.

A. N. Humphries and associates, who have been working all summer on No. 1 and No. 2 mines, on the north side of Mt. Hayden, near Ouray, have struck a vein which assayed seventy-six ounces in silver to the ton from the No. 1 and twenty-eight ounces from the No. 2.

#### SAN JUAN COUNTY.

(Special Correspondence).—The Gold King, at Gladstone, on Cement creek, is operating steadily on about 200 tons of ore per twenty-four hours, reducing that tonnage to forty tons of concentrate, the latter containing about 11% silica, 30% to 35% iron and a small per cent of lead. It is stated, however, that there is an increase of lead in some portions of the mine as depth is gained. In the concentrate values the gold stands first, silver second and copper third. A small valuation is saved on the amalgamating plates.

The mill has eighty stamps that drop at the rate of ninety-eight per minute and thirty-eight Frue vanners ranged in two rows in a vanner-room 40 feet wide by 210 feet long. The tables which handle the coarse material are given a speed of 208 revolutions per minute, those handling the middlings 194 and those carrying the slimes about 180. At the tail end of the plates below each 10-stamp battery is a box that receives the entire discharge, and within it is a centrifugal pump which sends it to a trough that discharges into hydraulic sizers, separating into three sizes for the tables. The concentrates are shoveled into carriers which convey them to the drying room, which consists of a metal floor, beneath which is a chamber

heated by exhaust steam from the boilers. The concentrates are spread over this floor for about fifteen hours, which reduces their moisture to about 4%. In the winter season the mill is heated by exhaust steam.

A belt conveyor delivers the ore from the No. 4 Gates crusher to the various bins over the batteries. The mill machinery is driven by a Westinghouse compound upright engine.

The mill is supplied with ore by two aerial tramway lines—one 5430 feet long, from the Gold King proper, and the other 3400 feet long from the American tunnel, which is a part of the same group. Both operate by gravity.

The American tunnel is driving for a point 900 feet below present Gold King workings, which it is expected to reach within three months. Its length will then be 1800 feet. The breast of this tunnel and the upper workings will be connected by an upraise. The tunnel that starts at the mill, and is being driven toward the Gold King proper, is now in 1400 feet, but has over 4000 feet yet to be driven. When complete, it will cut 1500 feet below present Gold King workings.

The Silverton, Gladstone & Northerly Railroad, virtually a part of the Gold King property, has been the means of advancing development along Cement creek and on Red and Bonita mountains by the satisfactory transportation facilities it provides.

The entire Gold King consolidation is under the management of W. Z. Kinney. The directors are mostly Eastern men, of whom Messrs. Davis and Soule of Boston, Mass., are among the most active members.

Gladstone, Aug. 24.

#### SAN MIGUEL COUNTY.

Manager J. H. Shockley, for the Four Metals M. Co., has made the final payment of \$14,000 on the Palmyra group, near Telluride. Watton & Dowd, who located the property several years ago, were the sellers. The Palmyra vein, in addition to development made by former owners, has been opened at an increased depth of several hundred feet by a cross-cut driven by present owners. Regular shipments of first-class ore are being made, but a milling plant is essential to the handling of the second-class stuff. This, it is stated, will be built next year. The same company has recently acquired the Andrus and Aztec mines, in Ingram basin, and development work is now being done on both.

#### SUMMIT COUNTY.

Robinson is to have a new pyritic smelter. Mr. De Vall of New York is employing forty men on the construction of the plant. The grading for the buildings is already being completed and a kin of bricks is being burned for the stacks.

#### TELLER COUNTY.

The Wild Horse strike at Cripple Creek is proving to be very rich. Returns received from twenty-two tons give its value at nearly \$200 per ton. The rich ore has been opened in two levels, of which it is showing up well.

The production of the Elkton at Cripple Creek for August will be the largest in the history of the mine, reaching 2500 tons of ore, nearly all of smelting grade. On the 700-foot level the drift has gone for 150 feet, showing 7 feet of an ore body that will ship at from \$75 to \$100 a ton.

The Maybel Co., near Lawrence, will install an electric hoist and sink the shaft for about 800 feet to reach the mineral bodies exposed in the operations conducted through the old works. This property is owned and operated by one of the sub-companies of the Woods Investment Co. of Colorado Springs.

C. J. Williams and associates have taken an eighteen months' lease on the main workings of the Pinnacle Co.'s property near Cameron. Work has been commenced by the lessees. The Pinnacle Co. has decided to lease all of its property not in operation at present.

The Blue Bird Co. at Victor has given the contractors an order to go 100 feet farther to the 1100-foot station in the shaft. The vein has not been reached on the 1000-foot level, but the crosscut is still being advanced.

J. B. Cunningham of Cripple Creek has leased the Hobo claim of the Katinka group at Cripple Creek. There is a 70-foot shaft on the mine, but he expects that it will be necessary to go 250 feet deeper before encountering ore.

The Mount Pisgah M. & M. Co., operating in High Park, near Cripple Creek, is rearranging machinery in their cyanide plant. The company intends heating the solution and will use a pneumatic process. The ore runs from \$10 to \$20 to the ton in gold.

All work has been suspended temporarily on the Wilson and Pinto of the Free Coinage, the controlling interest in which was held by the late S. Strong. The property has been worked under leases,

which end about Jan. 1st next. The July output was about 500 tons; gross value, \$20,000 to \$25,000. Plans for extensive improvements on the mine had been made. A new shaft and ore house were planned, and the old Pinto shaft was to be enlarged to a depth of 1500 feet. A hoist, three tubular boilers and an air compressor were to have been installed. What will be done now is not known. Hunter & Trimble of Leadville own largely in the mine.

## IDAHO.

## ELMORE COUNTY.

Lime Creek G. M. Co., Ltd., has been incorporated, with office at Mountainhome; capital, \$150,000. The directors are E. P. Cowan, W. F. Smith, J. M. Cowan, E. C. Helfrich and R. W. Smith—all of Mountainhome.

## IDAHO COUNTY.

A. Fralik and W. R. Grosse of Boise have bonded the Corder & Beck mine, in the Neal mining district, and are developing it. There are three ledges on the mine, with a tunnel 165 feet in on one of them—all in pay ore. It is proposed to explore the property this fall and install a mill before winter.

## KOOTENAI COUNTY.

The wagon road to the Buckhorn mine, near Bonner's Ferry, has been completed. The building of the stamp mill will be pushed. The mill will be set up with twenty stamps at the start, but provision is made for the addition of thirty more later. E. J. Foster is president of the Hoosier Boy G. M. Co., owning the mine.

## OWYHEE COUNTY.

The Poorman mine, at Silver City, is arranging to have an electric pump installed.

## SHOSHONE COUNTY.

The United States M. Co., Ltd., has been incorporated at Wardner by A. Page, H. France, G. Sonnemann, H. Deitrich and W. H. North, who are the directors. The capital stock is \$100,000.

The Sonora M. Co. has let a contract to continue its tunnel at Wallace and work has been resumed.

The California Con. M. Co. has been incorporated by J. Viles Jr. and A. E. Hedstrom of Chicago, Ill., F. S. McGraw of Buffalo, N. Y., J. P. Keane and A. H. Featherstone of Wallace. Buffalo, N. Y., is the principal office, with branches at Chicago and Wallace. The capital stock of \$1,000,000 is paid up by the deeding to the company by the incorporators of the California and Black Cloud groups of lodes, mill sites, water rights and concentrators at Wallace. Preparations are being made to commence work on the property.

Rice & Foss have bonded the Alice group of twenty claims on Ruddy gulch, near Mullan, to Col. Dewey of Nampa. Preparations are being made to do work on a large scale.

J. Dean and S. P. Smith have sold their Ruddy gulch property to F. Russell and A. G. Kearns of Wallace for \$5000.

## MICHIGAN.

## HOUGHTON COUNTY.

The plant operating on the Franklin tailing sands has been doubled in capacity. The plant is now treating 600 tons of old stamp sand daily with good results in copper. Supt. Mays, who was the original promoter of the plant, is said to claim that the process is a success and states that the company has decided to build an entirely new plant of the same capacity as that now in operation. Work on the new plant will be started by Sept. 15, and the buildings will be rushed so as to be inclosed before the snow flies.

## MONTANA.

## FERGUS COUNTY.

A survey has been made on the New Year mine, at Gilt Edge, for a 1000-foot tunnel, with a 350-foot upraise, work on which will be commenced at once. The mill has been idle for some time, but with the completion of the tramway under construction is expected to be running again to full capacity, 260 tons per day.

The New Year Gold Mines Co. have bought of J. L. Harmon for \$10,500 the Bach and the Kid quartz mining lodes in the Warm Spring mining district, near Gilt Edge.

The Abbey mining claim in the North Moccasin district, has been bonded for six months by F. S. Akely to J. R. Cook of Spokane, Wash., and extensive developments will begin at once.

## GRANITE COUNTY.

C. Smith, who, with Baggs & Royal, is working the extension of the Lead King mine at Garnet, says there is considerable work being done in and around the Garnet district, and some good ore is being taken out of the various properties.

## MADISON COUNTY.

The Kearsarge at Virginia City has

been bonded by W. B. Millard of Omaha, and is being operated under C. E. Dammours, manager. There is a 12-foot body of ore in the mine, which is worth \$65 a ton, and other workings in the mine show up equally promising. Arrangements for the reduction of the ore are to be made.

The General Shafter mine at Summit has been located on an extension of the Keystone lode. The managing operators are R. R. Smith Supt., T. H. Teal chemist, C. W. Sherwood and H. S. Ribbel millmen. The company has just built a 5-stamp mill and cyanide plant of forty tons daily capacity.

The Montana M. Co., with office at Marysville, has taken a lease and bond at \$100,000 on the Lester mine near Twin Bridges. The mine is owned by Jeffries & Armor and is a high-grade cyaniding proposition. The owners have opened up a 12-foot lead 265 feet by a tunnel 480 feet long. The new management will add new machinery and more fully develop the property.

The owners of the Mammoth properties on South Boulder, near Virginia City, have decided to build reduction works of more larger capacity and more modern appliances. It is also stated that the same men propose building a matte smelter.

The South Boulder M. Co. has machinery for a 10-stamp mill at its mill site at Mammoth, and expect to have it operating in October. This company is composed of Montana and Minnesota people.

## MEAGHER COUNTY.

G. E. Wiltse has struck 9 inches of copper glance on his claim at Copperopolis, close to the surface, in doing assessment work.

The ore from the iron mine near Copperopolis is said to run at the smelter 65% iron and 3% silica.

## SILVER BOW COUNTY.

The Butte & Iowa M. C. at Butte, recently incorporated, is beginning operations on the Colorado claim. It has put machinery on the mine after sinking the shaft to the water level. Sinking will be continued 500 feet and deeper if ore is struck. The work is in charge of J. Hewett, formerly foreman at the Gagnon. The principal stockholders are H. Mueller, E. Carroll, G. A. Cobban, J. A. Talbot and J. S. Shropshire.

## NEVADA.

## LANDER COUNTY.

The Dexter M. Co. has bonded at \$1000 the Pinto ground, near the mine which it is working. It is now reported from the mine at Tuscarora that from a single hole which had been shot into the Pinto, they had in a single shift taken out enough to pay for it. The new ground, which had been long worked as a placer, had been neglected for several years, and only taken up by the Dexter Co. because it was cheap and a chance.

## LINCOLN COUNTY.

The Arctic, Baltic and St. Lawrence mining claims of Searchlight have bonded to G. S. Wilson of Glasgow, Scotland, at \$20,000, of which sum \$2000 has been paid. The mines in the Copper King district, near Bunkerville, are working about twenty men and development continues increasing the showing of the property. The deepest working is now 200 feet below the surface. Supt. L. C. Bradley is pushing work on the several properties and states that a smelter is projected.

## WHITE PINE COUNTY.

A run of 13,000 pounds of ore belonging to R. Culver, taken from the Joana mine of Cocomongo, and treated at Ely, worked up to over \$120 per ton. Mr. Culver states that after paying for the hauling of this ore 16 miles and for the milling and for other expenses he had left over \$10 per day for wages.

## NEW MEXICO.

## SANTA FE COUNTY.

J. Blonger, of Santa Fe, has contracted with A. R. Gibson to sink a shaft 100 feet and drive a tunnel 100 feet on the Jones copper mine, 14 miles southeast of Santa Fe.

## SIERRA COUNTY.

B. S. Phillips, G. M. Miller, E. DeSoto and H. P. Lowe of Denver, Colo., have incorporated the Black Range G. M. Co., capital \$1,000,000, with office at Fairview; field of operation in Socorro and Sierra counties. The directors are T. Scales, B. S. Phillips, G. M. Miller, E. D. DeSoto and H. P. Lowe.

E. F. Pearson, of Santa Fe, has bought the Mamie Richmond gold-copper mine, located in the Hillsboro district.

## OKLAHOMA.

From Lawton it is reported that the oil excitement has superseded everything else, over a hundred oil claims being filed in a single day. Over a thousand mineral claims have been made, many of them copper claims. Native copper in two in-

stances has been found. Three springs from which oil flows constantly have been located, and in four places asphalt has been found oozing from the ground. Both liquid and solid asphalt have been found in a number of shafts. There is general ignorance of the mining laws among the majority of claimants, and it is said not one-third of the mining claims are properly marked. The richest mineral developments are in the western end of the Wichita mountains, on Otter creek. Here are found gold, silver, copper and zinc, and a mining district has been organized and a recorder elected, where all claims for the district will be filed.

## OREGON.

## BAKER COUNTY.

J. H. Stallings and J. T. Hudson of Salt Lake City, Utah, have bought the L. C. Van copper mines for \$10,000. The Van property consists of five claims, about 18 miles northeast of Baker City. Little development work has been done on the property, but there is a large body of ore exposed at the surface.

At the Maxwell mine, on Rock creek, near Baker City, owned by Pierce Bros., tunnel No. 14 is now in 500 feet and the ledge is averaging 4 feet wide. The 10-stamp mill has been started up, operating by water power under 200 feet head. Foreman Reeves is now employing twelve men. Between 4000 and 5000 feet of work has been done. There are twenty-eight claims belonging to the property.

W. W. Travillion and P. Mann have sold their placer and quartz ground in the Winterville district, near Baker City, to J. A. Dubbs of Denver, Colo., and C. F. Trump of Kahoka, Mo. The price paid for the property is understood to be about \$40,000. The property transferred comprises 390 acres of placer ground, four quartz claims, 44 miles of ditches and water rights in the Winterville and Bonanza districts. The company intend to incorporate at Salt Lake City under Utah laws. It is understood that extensive development of the mine will be begun at once.

It is reported that, while excavating in Whitney in the streets, a rich quartz ledge of free-gold ore was struck.

The Oregon M., D. & L. Co. has been incorporated in Salt Lake City, to operate mining properties, mills and smelters in Baker and Grant counties, Or. The capital is \$1,000,000. C. T. Trump is president and N. M. Vedder secretary of the company.

## GRANT COUNTY.

W. J. Patterson of Baker City and G. J. Barrett, owners of a number of claims near Granite, have bonded them to Illinois people, and men will be put at work on the property as soon as buildings are erected for boarding house and blacksmith shop. The price is understood to be \$40,000 and a large block of the stock of the company to be incorporated.

## JACKSON COUNTY.

From the two upper levels of the Dixie Queen mine, near Gold Hill, ore is being milled that averages \$100 to the ton. This rock was not from the stopes, but was that taken out in opening the tunnels. J. Fitzgibbon, the owner, is having a third and lower tunnel run to cut the ledge 400 feet down.

## JOSEPHINE COUNTY.

The Scribner-Henderson gold mine, on Wolf creek, near Grant's Pass, is worked by panning entirely. The gold is found in seams and stringers of decomposed quartz in porphyry at a serpentine contact. The rock, crushed in a hand mortar, pans from 25 cents to \$100 a pan, and in the nine months of operation a very large sum has been recovered.

The rich strike in the Ramsey mine, Mt. Reuben district, near Grant's Pass, is said to be proving richer than was at first anticipated. The ledge was tapped by a 60-foot tunnel, and at the point where the tunnel cut the ledge, a 5-foot vein showing free gold through the whole ledge has been opened up. The Ramsey mine was lately bought of J. Ramsey by J. C. Lewis and R. Jones.

J. R. Harvey, manager of the A. & B. mine and Old Channel mines, near Grant's Pass, is having the mines put in shape for next season's operations. At the first-named mine about thirty men are employed.

## SOUTH DAKOTA.

## CUSTER COUNTY.

The New York mica mine, near Custer, owned by C. A. Dow of Sioux City, Iowa, has been bought by B. H. Sullivan of Chicago, Ill., for, it is reported, \$50,000. The ledge of mica-bearing quartz is over 40 feet wide and it yields large blocks. The mine has been thoroughly developed and is shipping.

R. O. Ball of Denver, Colo., has been in the Harney Peak tin district in Pennington and Custer counties, getting together a large area of tin-bearing properties for

the Glendale Tin M. Co. of London, Eng., which has been reorganized and is to commence work immediately.

## PENNINGTON COUNTY.

A ledge of pyritic ore has been struck at Deadwood by J. T. Gillmore and associates. It runs well in gold, copper and iron, and makes a good flux for the Deadwood smelter. The ledge is over 40 feet wide. Across the gulch about ninety tons of this same character of ore are being shipped daily to the Golden Reward smelter for a flux.

Supt. Fillion of the Pluma M. Co. says work on their shaft will be resumed soon. From work done on the tunnel it is known that the shaft will strike a body of free-milling ore 250 feet down. The company expects to get water from the shaft at the 300-foot level to supply a mill.

## TEXAS.

## EL PASO COUNTY.

The Sunset and Buenos Ayres M. Cos., operating in Chihuahua, Mexico, have decided to erect the smelting plant in El Paso to get the advantage of railroad connection. S. L. Pearce, of Chihuahua, the general manager of the two mining companies, has plans all complete for a fifty-ton plant and says that the companies represented in the enterprise have sufficient mines in Mexico and Arizona to operate a smelter of that size but propose to do a general custom business besides.

## UTAH.

## BOX ELDER COUNTY.

A contract for a 500-foot tunnel on the Planetary at Park valley is to be let at once, and the site will be located by P. W. Madsen and J. B. Toronto, of Salt Lake City. Mr. Madsen will also let a contract for a 300-foot tunnel on the Ione.

The Delta M. Co. has been incorporated with \$50,000 capital. The company owns the Hanky Panky and five other mining claims in this county. P. Williams is president and E. O. Lee secretary and treasurer, with office at Salt Lake City.

The West Side M. Co. has been incorporated, capital \$30,000. S. Golding is president, A. C. Newell vice-president and O. D. McIntire secretary and treasurer of the company, with office at Standard, Idaho. The company owns the West Side group in Park valley.

## IRON COUNTY.

W. Jones of Salt Lake City has bonded all the claims on Iron mountain on behalf of Eastern people. In the aggregate the vendors are to receive \$300,000, or 10% of the purchase price, on or before October, the balance to be paid by January 1 next. If the proposition is sold there will be begun an iron smelting and steel making plant.

## JUAB COUNTY.

E. A. Wall of Salt Lake City has leased and bonded the Sioux and Utah claims at Tintic from R. D. Grant, who bought them from F. D. Farrel of Ansonia, Conn. The price named in the bond is said to be about \$500,000, as the claims cover 4500 feet along the strike of the vein of the Humburg and the Carisa.

An examination of the American Star and Blackbird claims at Tintic has been made by P. Ryan of Salt Lake City and J. T. Keil, representing the Pittsburgh, Pa., owners, and development is expected to follow in a short time.

The St. Louis mine at Tintic, owned by G. Bridges, has been incorporated as the Eureka-St. Louis M. Co. W. Hedrick is president, G. T. Bridges vice-president and J. W. Hatfield secretary.

## PIUTE COUNTY.

The Silver Cave property, near Marysville, is to have development work done on it at once. A. Jensen, manager, has started to run a 50-foot tunnel. W. E. Thurber of Richfield and O. Lee of North Monroe have leased their mine, near Marysville, to W. E. White of that place.

## SUMMIT COUNTY.

B. Hartwell of Park City has sold the Hall group of claims, situated near Park City, to P. A. Simpkins and associates, who are intending to develop the property. They are incorporating under the name of the Thayne's Canyon M. Co.

## WASATCH COUNTY.

The Wolverine M. Co. has been incorporated, capital \$150,000. M. L. Effinger is president and D. H. Peery, Jr., secretary and treasurer, with office at Salt Lake City. The company owns the Natural Arch group of five claims, in Snake Creek mining district, in Wasatch county.

The Potter Graystone Co. has been incorporated, capital \$300,000. G. R. Potter is president and E. D. R. Thompson secretary; office at Salt Lake City. The company owns the Emma's park graystone quarry placer mining claim and the Willow Creek graystone quarry placer mining claim, in Carbon and Wasatch

counties, from which the company proposes to quarry and sell stone.

The Pearl Silver M. Co. has been incorporated; capital, \$15,000. The company owns the Pearl J. C. and the George H. C. mining claims in the Blue Lodge mining district. J. Hatch is president and A. C. Hatch secretary, with office at Salt Lake City.

#### WASHINGTON.

##### FERRY COUNTY.

A body of copper ore has been opened on the Lucille Dreyfus, near Nelson. About 100 tons of ore have been taken out in development, which sampled \$27.50 gross and \$14.50 net after deducting smelter charges. B. E. Miller, president of the company, is arranging to make a shipment. A contract has been let for building  $\frac{1}{2}$  mile of road to connect the mine with the main wagon road to Grand Forks, B. C.

##### OKANOGAN COUNTY.

H. S. Stoolfing, manager of the Interstate M. & M. Co. of Spokane, is superintending work on the company's mine at Chelan. The company has let a contract on the Delate claim and the contractors are now down 40 feet. The vein is 4 feet wide and shows high-grade galena ore.

##### STEVENS COUNTY.

The Rambler mine at Springdale, which was recently opened up, is said to show over 7 feet of high-grade copper ore. J. Wolf, S. Emmerson and P. C. McGrath are the owners, and are making arrangements to open up the mine extensively.

Moore & Kern have bonded the Henshaw claims, near Springdale, for \$25,000 and are doing considerable work. They will build a road preparatory to shipping ore immediately.

#### WYOMING.

##### ALBANY COUNTY.

The Michigan copper mine in the McArthur group, near Laramie, has been sold to a company composed of J. H. Wear of Boone, Iowa, A. M. Ross of Cincinnati, Ohio, W. A. Whitney, F. H. Eggleston of Laramie and T. J. Cramer. The price is said to be \$10,000, 10% having been paid.

##### CARBON COUNTY.

Manager Miller has started up work on the Dangier C. M. Co.'s mine, after a shut down of several weeks. Eight men are employed on the tunnel heading, which is in 210 feet. An average of 2 feet advance a day is being made. Arrangements are made for the continuance of work all through the winter.

#### FOREIGN.

##### BRITISH COLUMBIA.

The Prospectors' Exchange of Nelson reports that the Reco-Goodenough properties, Slokan, are being worked together; the main lead runs through both properties. There are about twenty-five men employed. The McGuigan camp is one of the busiest in the Slokan at the present time. The Soho is developing and shipping small quantities of ore. The Antitone is working about ten men. On the Washington work is being pushed in the way of development and having a great deal of ore sacked. The Rambler is shipping steadily and its new concentrator will soon be completed. The Hewitt, Slokan district, is producing about ten tons of ore a day from development alone. Work is well under way in three levels. In the No. 3 level the ore body has widened to 35 feet; part of this can be taken out and sacked on the spot, the rest is concentrating ore. The shipping ore runs from 35 to 60 ounces in silver and from 3% to 6% in lead. There are 500 tons of rich ore sacked at the mine, which is being shipped over the tram. There are forty men employed on the property. The Whitewater now has sixty men working and has about completed the shipment of 1000 tons of concentrates to the Trail smelter. A discovery of cinnabar was made on the Cariboo by T. Edwards and C. Hanson, Greeley creek, about 8 miles from Revelstoke. There are 3 feet of ore exposed on the surface, which is rich in quicksilver. On the Poorman, Ft. Steele, an incline shaft has been run 45 feet in ore; the ledge at 25 feet was 7 feet between walls. The ore is copper carrying high values in silver. P. J. Nichols has bonded the Fern mine, Nelson district. Nearly 1500 feet of tunneling has been run on the ledge, which has an average width of 3 feet. There is a 10-stamp mill on the property. The ore carries gold and the average yield is said to be about \$60 per ton.

Nelson, August 24.

The Speculator group, adjoining the Arlington, in the Slokan, has been bought by a San Francisco company, known as the Ricovillabi M. Co., the stockholders in which include R. P. Rithet of Victoria and a number of San Francisco people. The claims embraced were the Specu-

lator, Speculator Fraction (staked in the survey), Mineral Mountain, Eda Fraction, Empire and Westside. The property has been under a bond which was taken up by the payment of \$49,000.

William Davis, resident director of the Transvaal-Zambesi Co., an English corporation, reports a strike on the company's properties at Erie. A crosscut has cut a wide vein, one of the shoots carrying silver, gold and lead, averaging \$70.

The Thistle G. M. Co. at Cariboo, B. A. Lassell manager, have already cleared \$6000 above all expenses, and from hydraulic mining pay a dividend the first year of their operation. The company have bought a number of claims adjoining their first purchase.

At the Onondago mines on Champlain creek, near Rossland, it has been decided to install water power and a compressor plant and double the size of the 10-stamp mill now erected. The property is owned by Will Bros. of Syracuse and St. Louis. Jones & Scott, from Cape Cormorrell, on the northern extremity of Vancouver Island, say they have found black sand there, bearing gold, and took out \$1100 in two weeks.

#### Personal.

HENRY BRATNOBER of London, Eng., is in Spokane, Wash.

C. E. AND W. LOOSE of Salt Lake City, Utah, are at Houghton, Mich.

P. G. GOW, Supt. Jumper mine, at Quartz, Cal., is in San Francisco.

H. G. LEE of Minneapolis, Minn., is examining mines at Eagleville, Nev.

J. BRESNAHAN of Spokane, Wash., has returned there from Nome, Alaska.

E. R. BUCKLEY of Wisconsin has been appointed State Geologist of Missouri.

W. H. MCCLINTOCK has resigned as Supt. Goldwin mine, near Sonora, Cal.

G. W. CROWE has been appointed manager Arizona G. & C. Co., at Patagonia, Ariz.

L. A. DUNHAM, manager Clifton Con. copper mines, Clifton, Ariz., is in New York.

H. ARMSTRONG of Republic, Wash., has returned to that place from Nome, Alaska.

C. D. JACKLING, late manager Republic Mill, Republic, Wash., is in Salt Lake City, Utah.

T. L. LAMMARS of Denver, Colo., has been appointed Supt. Enterprise mine, at Eldora, Colo.

A. E. SPRIGGS of Butte, Mont., has returned from a visit to Prince of Wales Island, Alaska.

WHITTAKER WRIGHT has resigned the managing directorship of the Le Roi M. Co., Rossland, B. C.

F. GUERRA has been appointed Supt. California King gold mines, at Picacho, San Diego county, Cal.

L. C. PARKER AND G. STEINBERG of Deer Lodge, Mont., are in Prince of Wales Island, Alaska, examining mines.

J. NICHOLS of Georgetown, Colo., is in charge of the mill of the Vacas-San Marcos silver-lead mine, Durango, Mexico.

R. J. FERGUSON of Kingman, Ariz., has been appointed Supt. of the concentrating plant of the Peacock copper mine, Cadiz, Cal.

#### Commercial Paragraphs.

THE American School of Correspondence in Boston, Mass., is claimed to be the only correspondence school in the country making a specialty of steam, electrical and mechanical engineering, heating, ventilating, plumbing and mechanical drawing. A postal card addressed to the American School of Correspondence, Boston, Mass., will procure a handsome handbook, describing its methods and courses and giving letters from graduates, expressing the results of their experience.

THE New Process Raw Hide Co., Syracuse, N. Y., reports that it has been obliged to run its bevel-gear planing machines nights during the last week in order to rush through a number of large bevel-gear wheels to repair a break-down for a big New England wire-drawing concern. The bevels are of cast iron, with teeth planed accurately to cone lines and are to take the place of cast gearing.

H. J. PUTMAN & Co. of Minneapolis, Minn., manufacturers of the Putman boots, state that their trade, especially among mining and civil engineers, has increased very rapidly during the past year, and that they are selling large quantities of their goods in nearly every civilized country of the world. They say that all Putman boots are made to measure, and the thoroughly equipped factory admits giving each pair the personal attention of a custom order. In connection with their

catalogue describing over thirty different styles of boots, adapted to hunters, engineers and prospectors, Putman & Co. are sending out a circular giving illustration of two special boots, particularly for use by mining engineers and persons employed in mountainous and rough country, illustrated and described, of interest to any engineer, and can be had upon application.

#### New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING AUGUST 20, 1901.

681,005.—SOLAR OVEN—M. M. Baker, S. F.  
680,833.—WATER MOTOR—Banning & Carey, Los Angeles, Cal.  
680,762.—CAN FILLING MACHINE—F. E. Caton, San Jose, Cal.  
680,816.—PLOW—W. M. Dowden, St. John, Cal.  
680,914.—BRICK KILN—Gray, Gray & South, S. F.  
681,169.—FRUIT PICKER'S SACK—A. Hamilton, Alhambra, Cal.  
680,859.—CLAMP—Hassler & Watters, Oakland, Cal.  
680,917.—COVER FOR KETTLES, ETC.—C. H. S. Helling, Alameda, Cal.  
680,918.—TRACTION ENGINE—J. E. Harris, Saratoga, Cal.  
680,919.—TROLLEY GUIDE—Geo. F. Heuser, Portland, Or.  
680,925.—CAN HOLDER—J. F. Kieley, San Jose, Cal.  
680,720.—SIGN—L. R. LeLande, Los Angeles, Cal.  
681,059.—LOOMS—J. H. Northrop, Tustin, Cal.  
680,938.—CONCENTRATOR—A. B. Paul, S. F.  
680,886.—WHEELED SCRAPER—C. Rath, Los Angeles, Cal.  
681,146.—HAY FORK—F. M. Standley, La Grande, Or.  
680,917.—PHOTO MOUNTS—P. J. Stuparich, S. F.  
680,910.—FRICTION CLUTCH—E. Turney, Portland, Or.  
680,822.—LOGGING HOOK—A. Wren, Seattle, Wash.  
681,088.—CLASP—Wait & White, Pendleton, Or.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COVER FOR POTS AND KETTLES.—No. 680,917 Aug. 20, 1901. C. H. S. Helling, Alameda, Cal. This invention is designed to provide a cover for culinary utensils, which cover has projecting lugs or hooks to engage the edge of the pot, and a lever pivoted eccentrically of said cover with its outer end provided with a projecting lug or hook adapted to engage the edge upon the opposite side where by the cover may be firmly locked upon the pot or disengaged therefrom. A segmental opening is formed upon one side between the hooks which allows the liquid to be poured off while the cover retains the solid contents.

BRICK KILN.—No. 680,914. Aug. 20, 1901. J. F. and H. N. Gray and R. South, San Francisco, Cal. This invention relates to improvements in brick and other burning kilns for similar purposes, and consists in an improved construction of the burning chambers, the arrangement of the brick or wares to be burned so as to provide open combustion chambers, a means for providing oil or liquid hydrocarbon as a fuel in the place of coal or other solid fuel, and a novel arrangement of the passages for connecting the burning chambers with the escape flue so that the "water smoke" is carried away from the "green" material without injuriously affecting the contents of the chamber. It also comprises a means of communication for keeping up the heat and passing from a series of chambers on one side of the kiln to those upon the other so that the corners may be turned without loss of effective heat. Means are employed for supplementing the heat passing through successive chambers and for the purpose of starting a burning in the first instance and thereafter to assist in keeping up the heat in turning corners.

CONCENTRATORS.—No. 680,938. Aug. 20, 1901. A. B. Paul, San Francisco, Cal. This invention is designed for the concentration of black sands, fine metallic copper, sulphurets and like heavy and valuable substances which are associated with lighter and worthless gangue. It consists of a longitudinally guided inclined movable table, with means for producing a longitudinal concussive movement, a closure for the lower end of the chamber, one or more compartments formed in the chamber, and a means for the discharge of the material to the closure, with adjustable discharge gates, and sots or channels made in the bottoms of the compartments, and arranged so that the material of the table. Horizontal plates are adapted to be adjusted upon each side of the slots and above the bottom of the table so as to regulate the flow and discharge of the material.

TRACTION ENGINE.—No. 680,918. Aug. 20, 1901. J. F. Harris, Saratoga, Cal. This engine is designed for traction purposes, and has an endless track so connected with it as to be constantly laid for the wheels to travel upon. Two main drivers are mounted upon a shaft which support the apparatus and rollers are disposed in front and in rear and in line with the drivers, so that an endless track upon each of the sets of wheels, passing around the rollers, is laid for the main wheels to travel upon. Elastic connections between the sections prevent the track from being forced up on soft ground, and keeps the dirt from clogging the spaces between the sections.

TROLLEY GUIDE.—No. 680,918. Aug. 20, 1901. Geo. F. Heuser, Portland, Or. This invention is designed to enable the trolley wheels, carried at the end of a pole upon street and other cars, to be easily replaced upon the conducting wire and disengaged. It comprises two outwardly flaring arms carried by the trolley wheel shaft, weights at the ends of these arms by which they are ordinarily depressed below the line of the wire, an extension by which the movement of the outer ends of the arms below the wire is limited, and means for attaching the trolley cord to this extension, so that the arms are automatically thrown into a vertical position, and are by their divergence they insure a sufficiently wide space to insure the conducting wire being embraced between them and thus directed so as to drop into the groove of the trolley wheel.

#### Latest Market Reports.

SAN FRANCISCO, Aug. 29, 1901.

SILVER.—Per oz., Troy; London, 27d (standard ounce, 925 fine); New York, bar silver, 58 $\frac{1}{2}$ c (1000 fine); San Francisco, 58 $\frac{1}{2}$ c; Mexican dollars, 47 $\frac{1}{2}$ c San Francisco, 45 $\frac{1}{2}$ c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62 $\frac{1}{2}$ ; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22 $\frac{1}{2}$ c. London: £66 10s per ton.

LEAD.—New York, \$4.37 $\frac{1}{2}$ ; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots, 5 $\frac{1}{2}$ c 1000 to 4000 lbs.; pipe 6, sheet 6 $\frac{1}{2}$ , bar 5 $\frac{1}{2}$ ; pig, \$5.25. London, £11 15s 9d per ton=2.56 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton=3.58 $\frac{1}{2}$  cts. per lb.; San Francisco, ton lots, 5 $\frac{1}{2}$ c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 $\frac{1}{2}$ c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30 $\frac{1}{2}$ c; 500 lbs., 30 $\frac{1}{2}$ c; less, 31c; bar tin, \$3.35.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 \$3 flask of 7 $\frac{1}{2}$  lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 \$3 lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 $\frac{1}{2}$ c; slab, 5 $\frac{1}{2}$ c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15 $\frac{1}{2}$ c.

PHOSPHORUS.—F. o. b. New York 50 $\frac{1}{2}$ c 60c \$3 lb.

ASSAY LITHARGE.—San Francisco, 10c \$3 lb. small lots.

BISMUTH.—New York, \$3.25 \$3 lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 \$3 lb.

PLATINUM.—San Francisco, crude, \$19 \$3 oz.; New York, \$20.50 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$3.25 \$3 lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37 $\frac{1}{2}$ %, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50 $\frac{1}{2}$ c \$3 lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c. POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 $\frac{1}{2}$ c; less than one ton, 17 $\frac{1}{2}$ c. No. 1\*, 60%, carload lots, 13 $\frac{1}{2}$ c; less than one ton, 15 $\frac{1}{2}$ c. No. 1\*\* 50%, carload lots, 11 $\frac{1}{2}$ c; less than one ton, 13 $\frac{1}{2}$ c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9 $\frac{1}{2}$ c; less than one ton, 11 $\frac{1}{2}$ c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9 $\frac{1}{2}$ c \$3 set; 14 oz., 40s., 8 $\frac{1}{2}$ c.

OILS.—Linsed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14 $\frac{1}{2}$ c; do., cs., 20 $\frac{1}{2}$ c; 86° Gasoline, bulk, 20c; do., cs., 26c; 65° Naphtha or Benzine, deodorized, in bulk, per gal., 13 $\frac{1}{2}$ c; do., in cs., 19 $\frac{1}{2}$ c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50 $\frac{1}{2}$ c; cs., 55 $\frac{1}{2}$ c.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

#### Recently Declared Mining Dividends.

# RISDON IRON WORKS.

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's."

MANUFACTURERS OF

Code: A. B. C. & Lelber's.

## Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

**GOLD DREDGES** Complete in  
Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

—WE ALSO BUILD—

**ALL KINDS OF**

Mining, Milling, Concentrating,  
Pumping, Air Compressing,  
Hydraulic, Water Wheel,  
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

SEND FOR DREDGING CATALOGUE NO. 17.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

## THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

**RISDON IRON WORKS, San Francisco, Cal.**

## "THE DANIEL BEST"

## 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

**EVERY ONE A SUCCESS AND MONEY MAKERS.**

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

**THE BEST MANUFACTURING COMPANY,**  
San Leandro, California.

# OUR PATENT WATER VAPORIZING ATTACHMENT

MEANS

A GUARANTEED SAVING OF 80 TO 90 PER CENT

of the water ordinarily used for the cooling of water jackets. It is one of the most important improvements made in smelter practice in recent years. Send for our catalogue which tells all about it and shows many different styles of Furnaces for the treatment of . . .

Gold, Silver, Lead and Copper Ores.

We design, manufacture and erect Smelters, and Mills for Concentration, Amalgamation, Chlorination and Cyanide Processes.

# THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## WHAT THEY SAY:

Capt. O. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## The sun cannot injure

Warehouse, Kern County Land Co., Bakersfield, Cal., Roofed with P & B Roofing and Graveled.

P & B  
Ready  
Roofing

During the months of July and August the sun beats down on the warehouse, herewith pictured, with terrific heat. The low, flat roof is covered with P & B Ready Roofing and unprotected from the sun.

Probably no other roofing is subjected to a more severe heat test than this, yet this roofing has not cracked, scaled, expanded or contracted nor run, neither has it required attention or expense since its first completion.

Furthermore, if this building were roofed with iron, shingles, tin or slate, the interior would be so hot in summer, no one could work inside without great discomfort.

P & B Ready Roofing is a non-conductor of heat and the interior of this warehouse remains at a lower and more even temperature than any other warehouse in Bakersfield.

Send for booklet giving complete information—Dept. A.

**PARAFFINE PAINT CO.,**

## THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

**MORAN FLEXIBLE JOINTS.**

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

An ANALYSIS of the Coal, Fuel Oil, Lubricating Oils, Boiler Compounds, Greases, Cleaning Compounds, Building Materials, Brasses, Metals and other substances or preparations you may be using, will sometimes open your eyes and save big money.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES

**Don't Take Chances**

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## ASSESSMENT NOTICES.

**YUBA CONSOLIDATED GOLD MINING COM-  
pany.**—Location of principal place of business, San  
Francisco, California; location of works, Nevada  
County, California.

Notice is hereby given, that at a meeting of the  
Board of Directors, held on the 19th day of Aug-  
ust, 1901, an assessment (No. 3) of three cents per  
share was levied upon the capital stock of the cor-  
poration, payable immediately in United States gold  
coin, to the secretary, at the office of the company,  
Room 801 Claus Spreckels Building, San Francisco,  
California.

Any stock upon which this assessment shall re-  
main unpaid on the 24th day of September, 1901, will  
be delinquent, and advertised for sale at public auc-  
tion; and unless payment is made before, will be  
sold on MONDAY, the 14th day of October, 1901, to  
pay the delinquent assessment, together with the  
costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—Room 801 Claus Spreckels Building, San  
Francisco, California.

**THE CALIFORNIA DREDGING COMPANY.**—Prin-  
cipal place of business, 120 Sutter Street, San  
Francisco, California.

Notice is hereby given, that at a meeting of the  
Board of Directors, held on the 6th day of August,  
1901, an assessment of 10 cents per share was levied upon  
the capital stock of the corporation, payable im-  
mediately in gold coin, to the secretary of the cor-  
poration, at the office of the company, Room 56, 120  
Sutter Street, San Francisco, California.

Any stock upon which this assessment shall re-  
main unpaid on the 24th day of September, 1901, will  
be delinquent, and advertised for sale at public auc-  
tion; and unless payment is made before, will be  
sold on TUESDAY, the 1st day of October, 1901, to  
pay the delinquent assessment, together with the  
costs of advertising and expenses of sale.

(Signed) SAM. W. CHEYNEV, Secretary.

120 Sutter Street, San Francisco, California.

**ETNA PETROLEUM COMPANY.**—Prin-  
cipal place of business, San Francisco, California. Loca-  
tion of works, Fresno County, California.

Notice is hereby given, that at a meeting of the  
Board of Directors, held on the 22nd day of August,  
1901, an assessment of ten (10) dollars per share  
was levied upon the capital stock of the corpora-  
tion, payable immediately to the secretary, at the  
office of the company, No. 316 California street,  
San Francisco, California.

Any stock upon which this assessment shall re-  
main unpaid on the 24th day of September, 1901,  
will be delinquent, and advertised for sale at public  
auction; and unless payment is made before, will be  
sold on the 14th day of October, 1901, to pay the  
delinquent assessment, together with costs of ad-  
vertising and expenses of sale.

R. F. MACLEOD, Secretary.

Office—No. 316 California street, San Francisco,  
California.

**WILLIETTA MINING & MILLING COMPANY.**—Prin-  
cipal place of business, San Francisco, California; loca-  
tion of works, Tuolumne  
County, California.

Notice is hereby given, that at a meeting of the  
Board of Directors, held on the 19th day of August,  
1901, an assessment (No. 2) of one (1) cent per  
share was levied upon the capital stock of the cor-  
poration, payable immediately in United States  
gold coin, to the secretary, at the office of the com-  
pany, Room 8, 206 Sansome street, San Francisco,  
California.

Any stock upon which this assessment shall re-  
main unpaid on the 30th day of September, 1901,  
will be delinquent, and advertised for sale at public  
auction; and unless payment is made before, will  
be sold on MONDAY, the 21st day of October,  
1901, to pay the delinquent assessment, together  
with the costs of advertising and expenses of sale.  
By order of the Board of Directors.

FRANK E. CORDES, Secretary.

Office—Room 8, 206 Sansome street, San Francisco,  
California.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

## THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine.

CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings.

The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

### CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from  $\frac{1}{4}$  to  $\frac{1}{2}$  greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

### WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Mining Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Boise ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

O. W. PURSELL.

Commenting on the opinion of Prof. George F. Becker of the U. S. Geologic Survey that the Transvaal could produce gold at the rate of \$100,000,000 a year for the next thirty years, Mr. C. W. Purrington, who has traveled in Siberia and examined some mining propositions there, says in the Engineering Magazine for September that, in his opinion, providing American machinery and gold mining methods

Siberia is a land of magnificent distances. Magnificent distances separate the placer deposits from

Siberia has excellent possibilities for the use of American mining and milling machinery. It has more

There is a very large area in Siberia that contains minable gold deposits—a far larger area undoubtedly than has even been explored yet. It is a much dif-

The fact is Siberia is not much unlike the Yukon and Nome regions of Alaska in its mines. It is no better because a great deal bigger. Absurd, extravagant estimates of possible gold yield from Siberia, based on a leadpencil, should not be permitted to add to the already heavy overburden of popular misinformation concerning a comparatively new country, desirable for what it is.

Personal; Recently Declared Mining Dividends; Commercial Paragraphs; Catalogues Received; New Patents; Notices of Recent Patents, 104.

In pursuance of its policy through the years this paper presents in this issue a carefully written and accurate statement of facts regarding the mineral wealth and present status of development of a portion of the great territory of Alaska now attracting deserved attention. The article on page 98 was written especially for this journal, the data secured involving the skilled services of an expert mining engineer, who at considerable expense made personal examination of that region in the interests of this journal. There are few parts of this west half of America that have not been visited by some competent representative of the MINING AND SCIENTIFIC PRESS, and the development and attendant prosperity of many a mining region has been confessedly aided and stimulated by the early publicity thus given to accurate technical data and commercial information concerning it.

NEW mining districts are apt to get more or less adverse criticism through the disposition of prospectors to demand cash payments down, with bonds, on their undeveloped claims. In this, as a rule, they only reflect market conditions. In a new district, almost any sort of a prospect has some exchange value. There are always more than the usual number of buyers looking for the big mine that the prospector locates, without knowing what he has really found. Prospecting in new districts involves cash outlays by prospectors that they feel the separation from, when it is a question of bonding their claims on time without cash payment. More than the others, the fact that buyers are seeking the mines, not the mines the buyers, tends to create the prospectors' disposition. In old mining districts, prospects are differently regarded. The sure, easy-made mines are assumed to have been picked out and made. What remains is assumed to carry more hazard as to its being a mine at all. What prospecting investment has been made is not felt by the prospector to the same extent as in a new district. His own personal position is different. He has interests in the district that are independent of the prospect he is offering to sell, where in the new district he has yet to make such ties. He has to go to the mine buyer, the latter does not come to him. All things considered, the disposition of prospectors in new districts to expect a cash payment on account on giving a bond on prospect claims has a reasonable basis, and investors who seek such claims should consider such propositions as legitimate business and entitled to reasonable consideration. The amount of cash down that is asked is usually not a large sum, and if the prospect showing does not justify it, better leave the prospect alone even if it can be had without a cash payment. The question is finally, however, a matter of contract, adjusting itself in the end to the mutual satisfaction of interested parties.

## A Theorem or an Observation.

A strike of the workmen employed in the Le Roi mine of Rossland, B. C., has closed down the mine. The ostensible reason for the strike is stated by the workmen to be the refusal of the mine management to pay the common underground laborers, who pushed cars and shoveled rock into them, \$3 a day in place of \$2.50. The real reason was the intention by the mine workmen in the Le Roi mine, and in other mines and in other places, to establish the principle that they ran the mine, and not the men in London, who supposed they did when they bought and paid for it by their own labor.

To the mine workmen the "principle" is a sort of fetish that they consider should be bowed to and sacredly regarded, even though it has not been demonstrated to have a money-convertible value. The men in London undoubtedly consider the "principle" wrong, and anyway it is not their fetish, because—if for no other reason—it is not a value convertible into money. The men in London who think they own the mine want "results" from owning it which are convertible into money.

In this business difference between the two parties, a dispassionate, disinterested analysis of the real difference shows, that of two things separating them, neither party really wants the thing the other party wants. What reason is there, then, why each party should not have the thing he wants undisputed by the other, and so end a business difference which, if this point of view is logical, does not exist? Why should not the Le Roi mine workmen have the "principle" and run the mine, and, at the same time, the men in London have the "results" and get the money?

The books of costs kept by the mine management show for a considerable period of time the segregated costs per ton of ore loaded on the cars at the mine, for labor, service, material, supplies, dead work, maintenance of machinery of the mine, sorting of ore and loading the ore. The minimum average grade of the ore desired for shipment is known. The number of men in each department of labor is known. The capacity of the operating machinery is known. The additional sum that the difference of 50 cents a day added to muckers' wages would make is known.

Suppose the management add this last sum to the total of the other known costs. If it should become necessary, the management can raise the minimum average grade of the ore desired for shipment to compensate this addition of cost. Then suppose the management offer to make a direct contract with an association of about the same number of mine workmen, in proper proportion for the several departments, to mine the ore and put it on the cars—in brief, to run the mine as a mine.

The conditions established by the management might be that a bid could not be considered in a sum per ton in excess of the total of the costs, as shown by their books of past operations, plus the cost for the added 50 cents a day to muckers. Nor would a bid be considered lower than the total of costs as shown by their books for past operation. The mine management can be presumed satisfied with a minimum bid that makes the cost the same sum it has been paying. The mine workers in their demand for the increased wages claimed that they would give an equivalent in increased efficiency. They can be presumed satisfied to make a maximum bid not more than the additional wages for the muckers would require. All supplies and material would be supplied by the management to the contracting mine workers at the same unit costs as paid in past operations. The ore delivered for shipment from the mine would have to be of the average grade demanded by the management and no less in ton value.

The mine workers on their part could fix the rate of wages they would pay themselves, choose their own foremen and work their own hours. They would receive in money the value of all that they saved in supplies and material, and would have all the gain that came from increased output per man. All earning on the contract, however, over and above the wages they pay themselves, and costs of supplies and material, should be divided equally, share and share alike, in proportion to the time worked by each man. The difference in kind of

work or rate of wages should not enter into this division. Each workman has in theory contributed equally, and should therefore share equally. The mine workers' association should be debarred absolutely from hiring labor for wages. All employed must be sharers.

The contract here outlined is a large one. It can not, however, be divided without losing the very thing that is its essence, namely, the undivided responsibility of the mine workmen in running the mine. Preferably it should be bid for and given to the late mine workers of the Le Roi mine; but, if they do not bid equally low with the lowest offer, the bid of other associations of mine workmen should be accepted. As the miners' unions are organized by separate trades or employments, no one of them could make the contract; but the workmen could merge the unions so that they could bid as though a single organization.

The mine management is reported to be considering a bid from a contractor to take out ore, and it has been commented thereon that the acceptance of such a bid would clear up the difficulty that caused the strike. The fact is that it would do just the opposite. It cannot be presumed that the mine management would contract at a higher figure than that of their own operations as shown by their costs accounting. If at the same figure or less, the contractor's profit, which is the inducement for him to make the contract, reduces by its amount what the mine workmen have been receiving heretofore.

The mine workmen may or may not be equal to the opportunity of a contract by which they get all the benefit of their trade skill and a union organization. Under such a contract they work for themselves. They fix their own hours, their own wages, select their own supervision and select their own personnel. If they are not equal to the opportunity, it is because the intelligence required to work constructively for themselves is of a different and superior order from that required to work destructively against others.

In the suggestion that the mine management contract with the mine workers direct for the production of their labor, a division of profit of the mine is not implied. The mine worker is given, first, what the mine owner is willing to give, and the mine worker to accept, and given, second, what he gains from the opportunity of adding the efficiency of his brain to his labor, without depriving the mine owner of anything he has or can get.

The preceding discussion is not intended as the solution of the economic question of the strike at the Le Roi mine. At the most, it is merely a statement of the theorem of the facts to which at the end is not even written Q. E. D. At the least, it is the writer's manner of stating his absolute agreement with what each party to the question says of itself and thinks of the other party.

THE Texas Legislature has under consideration a proposition to tax the oil wells 2% on their gross output. The 2% does not seem unreasonable, though it may not be equitable when taxation on other property is considered. It is perfectly clear that the only thing about the oil land and the oil well that has real value is the oil after it has reached the surface and become a commodity. The taxation of a hole in the ground does not seem to have a basis in reason. There is a recognition of the real valuable thing by men in the character of their dealings with each other over oil lands. Rental is made a payment in kind out of the production, if any. The State is proposing in a 2% tax on production, a rental in kind. If it ends with that tax, it should be satisfactory to petroleum well owners, provided that the 2% rate does not place on their property an unequal burden of taxation. Whatever question there may be is in the equality of the 2% flat tax. It would seem that 1% would come much closer to giving the industry only an equal burden as assessment undervaluation of other kinds of property are notorious. A tax rate of 2% on an assessment valuation that is only 25% of the market value of property is only equivalent to  $\frac{1}{5}$  on the market value. The rate of 2% on petroleum is from its nature on the market value. However, Texas petroleum producers are to be congratulated on being taxed as rationally and reasonably as is proposed. They are fortunate in not having California taxation laws and assessors.

## Concentrates.

A MEXICAN LAW requires that 80% of the labor employed at mines shall be native Mexican.

A COPPER WIRE, 00 B. & S. gauge, will weigh 2129 pounds to the mile.

THE Russian unit of weight is the pood, 36.114 pounds avoirdupois. Coal and gold are alike measured by it.

THE average fineness of California placer gold is 885 gold and 115 silver. Of Siberian gold is 930 gold and 70 silver.

BOTH draw temper and plunge temper for drill steel have their advocates among mine blacksmiths. Practically machine drills have to be given a plunge temper.

THE commercial price of graphite in New York is dependent on the quality from \$8 a ton to \$80. The best grade of American graphite pulverized is worth \$30 a ton.

CONTRARY to commonly received opinion, it is stated that experiments made to determine loss of coal through exposure to weather show that the loss of calorific power was slight.

THE expansion of the production of gold has been accompanied by an equivalent expansion of the uses of gold in the arts. The quantity of coined money has not increased in the ratio of the gain of production.

THE capacity for work of the Russian peasant who is the mine laborer of the country is reduced by the frequent legal holidays which he is sure to observe as part of his religion. Some of them require three days celebration.

THE economic unit in mills for free milling gold ore has steadily gained in the number of stamps that can be handled by two men on a shift. Where at first ten stamps was the economic unit, forty stamps is now the number.

BEFORE starting to drill a hole in rock, the place decided on should be thoroughly cleaned of loosened rock by the pick and hammer. Everything that the drill might start as it was driven should be taken out before starting the drill.

ONE of the big Beaumont, Texas, spouting oil wells got away after it had been capped and caused the death of three men who tried to get control of it. A workman in a diving suit finally reduced it to control without danger to himself.

THE quantity of coal consumed per horse-power hour by marine engines is now 1.5 pounds, as compared with 1.75 pounds ten years ago. Where it required ten pounds of coal to carry one ton of cargo 100 miles ten years ago, it is now done with four pounds.

A REGULATION of the water jet on the buckets of a Pelton wheel has been effected by dividing the buckets and causing the two halves to approach or separate, permitting a part of the jet to pass between the sections. This does away with the deflecting nozzle.

DURING the year ending June 30, 1900, the U. S. Government patents on account of railroad grants covered 2,470,804 acres. There still remain in the public domain 914,096,074 acres of land which have not been appropriated. Much of that area has not been surveyed.

THE probable value of the energy transmitted to the earth from the sun is stated to be about 133-foot pounds per second per square foot of receiving area, or 0.24 H. P. Recent experiments at Pasadena, Cal., gave a result of about 1 H. P. for 100 square feet of reflecting surface.

THE Dominion of Canada is making a geological survey of the Boundary district in British Columbia. The area to be covered extends on the international boundary line from Kettle river to Okanogan lake, and about 100 miles north from it. Topographic and mineral maps will be published.

WHILE the economists and traffic experts are deciding that electricity cannot be substituted for steam for transportation by rail outside of a short distance limit the business men and working engineers are raising the limit till it appears doubtful if there is a limit at all to the commercial substitution.

THE presence of charcoal in old tailings which are being cyanided will account for some loss of gold, the charcoal being a precipitant of gold. Roots and other vegetable matter will soak up solution and take whatever gold there is in the solution into the final tailings, but loss from this is comparatively insignificant.

FOR hand drilling, the blacksmith should prepare the drills in sets. A drill hole gets smaller in diameter as it gets farther in, owing to the wear of the rock taking down the flared corners of each drill first, and thus reducing the length of the cutting edge which does the last work of cutting before the drill is discarded for a sharp one.

SAN FRANCISCO shipping has heretofore had little or no installation of loading and unloading machinery as a substitute for manual labor. One result of the strike of the stevedores has been the introduction of electric grain loading machinery at Port Costa, by which one man tending the machine does the work that required five men formerly.

ADVANCING a drift heading 7 feet high by 6 wide, in tightly cemented gravel, drilling by hand, will use about three pounds of 40% dynamite to the foot. Compari-

sons made by different methods of drilling and shooting have shown that in this character of ground there is not likely to be any gain of lowered cost made by shooting the full round of holes at one time over shooting out a center cut first.

IN the manufacture of commercial asbestos the serpentine rock containing it, as it comes from the mine, is first hand-sorted, using hammers on larger pieces, then crushed and picked over again on a belt, the waste being thrown out. It is further passed over a series of screens, which take out rock dust and short broken asbestos fiber before the clear commercial grade of fiber gets to the packers.

BY a bushel of coal or charcoal is always understood the heaped bushel, which is equal to 2688 cubic inches. The bushel of the table of dry measure in common use is what is known as the struck bushel, equal to 2150.42 cubic inches. In measuring coal by the bushel unit it is always broken coal that is referred to. Coal in place is not measured by that unit, but by the long ton of 2240 pounds. A bushel of bituminous coal weighs from 70 to 78 pounds, of charcoal weighs from 23 to 46 pounds.

THE Arizona underground river found in a limestone cave may come from subterranean springs, but is more likely to be the diversion of a surface stream into the cave through some higher opening. It is even more unlikely to continue flowing underground, particularly if a large stream. Diverting out of the cave may disclose where it was going in its natural course, particularly if the act of diversion is accompanied by a corresponding loss of water to some one using it below without knowing its source.

A CEMENT which is proof against the influence of acids can be prepared by melting together one part of India rubber with two parts of linseed oil. This should be gradually incorporated with three parts of bole (a fine-grained ochreous clay), so as to form a plastic mass. This when heated softens but very little. Though it does not easily dry upon the surface, when once set it is not affected at all by nitric acid. Its drying and hardening is materially promoted by mixing with one-fifth of its weight of litharge or minium.

TO LIGHT a number of fuses for a round of holes loaded for blasting, it is customary among the Western miners to "spit" the fuse, as they term it. The end of the fuse is spread a little and a small pea-size piece of dynamite is pressed down into it. This fires readily and starts the powder of the fuse, which sometimes without the spitting refuses to fire as quickly as the miner would like. In Colorado mines a make of fuse is used so that the miner can bunch the clear ends and light all together with one fire without spitting.

EVERY operation involves some waste which may or may not be loss, according as it is commercially avoidable or unavoidable. Comparative efficiency is a comparison of final commercial results rather than a direct measurement of the magnitude of the waste in one case against the waste in another. Particularly is this true of the operation of mines and the reduction of ores. The point where a waste becomes a loss can best be determined by some actual physical trials, coupled with close book-keeping records and analysis of them.

THE cost of obtaining a patent to a mining claim is subject to considerable variation. Outside of the land, for which \$5 an acre is paid for lode claims and \$2.50 an acre for placer claims, the costs are: Deposit with the Surveyor-General for an official work on survey plats and stationery, \$40; deputy surveyor from \$40 to \$200, dependent on the time required to do the surveying in the field; notary fees for survey and application for patent, \$10; \$30 to \$60 for newspaper publication of application; attorney's fee not less than \$50; Register and Receiver Land Office fees, \$15. The total, without the land, will be from \$200 to \$400.

WHERE slip joint riveted sheet metal pipe is used under pressure for water distributing service, it is desirable, even if the pipe is fully buried, to set the crosses, T's, elbows and gates, in masses of concrete sufficiently heavy to hold the pipe in place against shock. Slip joints are not perfectly tight, and what is called water hammer, the cumulative effect of turning off discharge valves suddenly, tends continually to loosen the slip and make leaks, the water softening the ground in the trench the tendency of the pipe to yield continually increases. The effect of the solid concrete masses at the crosses, T's, elbows and gates is to take up the water ram shock and prevent it from starting the leaks.

A SIPHON is frequently a convenient and inexpensive pumping rig for a mine where the water does not require to be lifted more than the air pressure water column height of the altitude of the work. Water can be lifted from a winze in a drift floor by carrying the discharge end of the pipe siphon down the drift till it is lower than the inlet. Where possible, to avoid the frequent filling of the pipe and restarting required as a result of the accumulation of air at the high point, a water inlet pipe from a pressure source is connected at the high point and a jet discharge is introduced into the siphon pipe and directed toward the discharge end. With this the pipe can be kept full and the flow is assisted by the acceleration and suction of the jet stream which can be regulated as to quantity and force at the pleasure of the operator.

A MINE which shows high commercial values and large quantities of ore should not be condemned and abandoned on the unsupported evidence of a failure to find similar ore values in a tunnel heading several hun-

dred feet underneath the surface showing. Ore shoots do not have to go down vertically, and with no work in the surface determining dip, the pointing of a tunnel to pick one up at several hundred feet of depth is pure speculation, and not mining. The tunnel may pass one side of the shoot or it may enter the vein in a horizontal barren zone. Where the mistake has been made of driving the tunnel, and taking needless chances before more than scratching the surface of the rich outcrop has been done, the proper thing to do if the tunnel fails to find ore, is to go to the outcrop, sink on it in the ore, and mine the latter out exactly if there was no tunnel at all. The extending of developments from the outcrop may ultimately indicate how to make the tunnel useful.

TO FACILITATE the cleaning of pressure boxes at the head of power pipe lines of the accumulation of floating trash, they should preferably be set on an inclination of about 60° from the bottom of the box, with the direction of the slope toward the inflow of water into the box. Such screens should be made of large area, with small mesh holes, the aggregate area of opening of the holes being such that a very low rate of flow, say, 2 feet to the second, will keep the pipe full to the water level of the pressure box. Trash will then collect against the screen, but is not liable to become enmeshed in it. Closing the inlet gate to the pressure box and opening the cleaning gate, the water in the head of the pipe beyond the screen, flowing back through the screen, sweeps the accumulations that were plastered against it into the waste. Its tendency is to fall away from the screen, and not into it.

IN mines a large amount of steel is consumed by the loss of drills, mols and bars. The principal cause of these losses comes from the hiding of the tools, particularly drills, by miners to insure to them a supply when needed later. Once hidden, it is frequently forgotten and becomes lost. The surest way to break up the habit is for the mine owner to see that the mine is amply supplied at the start, and that the blacksmith and tenders keep plenty of sharpened steel at the stations at all times. When the miner finds that he can get plenty of steel without having to store it in advance he will cease to hide it. The hiding of the steel for the purpose of insuring a working supply of tools is not to be considered a fault of the miner. It is unconscious evidence of his wish to give his full equivalent of work for his wages. The fault rests with the mine management that creates the condition.

A FOUNDATION for machinery can be built economically where the surface soil is so deep that going to bed-rock is impracticable, and where concrete cannot be used on account of the high cost of the materials, by building a heavy log cribbing in the surface soil. An excavation of ample area and depth should be made. The character of the soil and weight and power of the machinery determine this. In light soils, with an 80 H. P. engine to be held in place, a cribbing 16x24 and going 20 feet below the surface is not extravagant. The cribbing should be pin or bolt-fastened, and the soil is thrown back and tamped in tight with water as it is built upward. The foundation bolts should go to mudsills deep down into the cribbing timbers. The effect is to make of the crib the equivalent of a concrete block. Such a foundation, made as described, will be found free from unequal settlement and vibration.

SIBERIAN placer mining tailings are a poor investment for foreign capital. There is not the amount of gold in them that there is represented to be by the Russians. There is not the quantity of them at any one point that justifies the power and plant installation necessary to rework them. The system of mining carried on everywhere under the direct supervisions of Russian government mining engineers results in placers being worked in pits of varying size. From the washing machine, whatever it may be, the tailings are carted away and dumped where designated by the engineer. One small pit will provide several such piles, no one of them containing many thousand cubic yards of gravel. Sampling these piles values may be had from 10 to 30 cents a cubic yard, and with some of the oldest rich workings where quicksilver was used without understanding there may be values as high as \$1 to the yard. These values and the quantities of tailings are insufficient to justify the investment of capital. In Siberia they do not attract even the Chinese, who are close miners there as here.

THE adulteration of placer gold dust, or the imitation of it, that has deceived gold dust buyers in Nome and Dawson is effected, according to descriptions given, by coating the base metal grains with gold. The streak test ordinarily should detect this, for the coating would almost certainly have to be purer gold than the genuine dust of the district. If the imitation is mixed with the real and the dust fine, a very sure test, and one made at the expense of little time and cost, can be made as follows: Test the streak of some grains for the color and preserve it for a comparison. Take from ten to twenty grains of the dust without selecting, mix it with borax to make a slag, fuse under the blowpipe on charcoal, using gas or a spirit lamp. It will melt to a button, which can then be tested for streak and comparison be made with the streak preserved. There should be practically no difference in color. If there is a marked difference, it is safe to conclude the gold dust contains more or less base metal that should not be there. A gold dust buyer should be prepared to melt the entire lot of any questionable gold dust offered him, and determine its value from the streak of the melted bar.

## Ketchikan Mining District, Alaska.\*

Written for the MINING AND SCIENTIFIC PRESS.

Ketchikan mining district, as it is commonly referred to and described, is inclusive of all of the area of Alaska south of Wrangel to the international boundary—an area, roughly, 130 miles north and south by 150 miles east and west. Of land and water it takes in about 20,000 square miles. Besides the mainland from Portland canal, nearly to the Stickeen river, it includes a great number of islands, principal among which at the present time, by reason of mineral discoveries, are Prince of Wales, Revillagigido, Annette, Gravina, Dall and Kosciusko. Other large islands, of which little or nothing is yet known as to mineral resources, are Wrangel, Zarembo, Etolin and Duke. A reference to the map on the front page will give an intelligible idea of the geographical relations between the islands and the mainland.

The topography of both the islands and the mainland is mountainous. There is little or no plain land at all, and little of the area is what might be described as hilly. The effect of the whole is of a plateau surface eroded into canyons and sharp summits and then submerged until the lower canyon cuts are submerged beneath the sea waters. The latter form straits, sounds, bays, inlets and fiords or canals as it is the local custom to name them. They so cut the land up into narrow bodies that no point is distant 5 miles from the sea. These waters are so comparatively sheltered that boat landing is practicable almost anywhere on the shore lines in summer and there are many safe sheltered harbors for any weather. The exploitation of the district is thus exceedingly facilitated by accessibility to the cheapest of all transportation roads—the open sea.

The mining history of the district is very recent. Probably the first notice of mineral of value in it was a discovery of copper-bearing deposits of great extent made between 1870 and 1874 by prospectors who were exploring for W. C. Ralston of San Francisco, Cal. His death in the latter year put an end to further investigation at that time, and the slight knowledge of the discovery obtained gradually disappeared from the memories of the men who made it. It is believed, from the description, to be the deposit on Mt. Andrew, on Kasaan Peninsula, Prince of Wales Island, rediscovered in 1899 as a result of the recalling of knowledge of the old unlocated discovery. The second note of mineral was the discovery of gold on the eastern shore of Annette Island, about 1891 or 1892, by James Bowden. He and others located claims, but were prevented from working them by reason of the island having been set apart by Congress for the use of the civilized Metlakahla Indians, who had removed there from the neighboring British Columbian mainland. The third notice of mineral values were discoveries made late in 1897 and since as a result of the Klondike discoveries taking many miners into the country. This last discovery has been followed by extensive exploration and some exploitation, and has laid the basis on which is being built the beginning of what will soon be one of the great centers of mining industry in the United States.

Ketchikan, from which the district gets its name, was in April, 1899, a salmon saltery, with a population of about twenty whites and twice as many Indians, all dependent on the salmon fishing business. It is situated on Tongass Narrows, on Revillagigido Island, on the inside route taken by all the steam vessels sailing between Seattle in Washington and Juneau and Skaguay in Alaska. It is at the present time the most central and generally accessible point for all the mines and small mining camps that have been established in the district. Its growth started in 1899 and has continued steady and substantial ever since. At the present time the population is about 750. The town is incorporated, has water works, a fire department, a school, church, three large general stores and mine outfitting establishments, hotels, a weekly newspaper and a large salmon canning establishment. It is a port of entry, and all vessels taking the inside route for Alaska enter and clear there. It is the mail-distributing center for all the other postoffices in the district and the home port of a local steamer line which distributes the traffic which the mining is building up. At Ketchikan there is no mine exploitation under way, though prospecting has developed some possible low-grade gold propositions, the ores, which are pyritic, carrying some silver and copper as well. The different ore bodies are mineralized quartzite dikes and segregated quartz seams in chloritic schists. There is little or no oxidation of the sulphides, and economic values cannot be said to be proven yet.

On Revillagigido Island, on Thorne Arm Inlet, due east of Ketchikan, and 24 miles distant by water, is the Sea Level mine, at the postoffice of Sealevel, E. C. Morse superintendent. The mine consists of two quartz ledges, dipping nearly vertical and separated by a garnet-bearing porphyry dike. The veins average 4 feet in width of clean white quartz carrying free gold. Both veins are operated through one shaft, and levels have been run several hundred feet, blocking out a large body of ore that is expected to mill about \$5 a ton. The contract has been let for a 30-

stamp water-power mill. In the locality of Sea Level, between Thorne Arm and Behm Canal, many other quartz veins and promising prospects have been opened up.

On George's Inlet, also on Revillagigido Island, about 15 miles by water from Ketchikan, a large number of locations have been made, but only assessment work has been done on them. One lode outcrops for 2 miles and is several hundred feet wide. The ore is low-grade, largely silver-bearing galena in a quartz gangue. On the northern side of the island, at Traitor's Cove, some rich gold-quartz pockets have been found on the beach; but the veins, so far as followed inland on the surface, proved small and have not been exploited. Except close to the water's edge and in the particular localities noted, Revillagigido Island has been very little explored for valuable minerals. Fully nine-tenths of the area is untrampled even. The formations generally are highly metamorphic and siliceous schists, and quartz porphyry eruptives. The strike of the formation is N. N. W. and S. S. E. The mineral values, so far as developed, seem principally gold, with silver, lead and copper, in the order named. All three of the latter would commercially seem by-products to mining for gold.

On the mainland of the district there are three widely separated localities already discovered to be mineral-bearing. On Boca de Quadra, an inlet off of Revillagigido Channel, between Behm Canal and Portland Canal, some gold placers have been found and prospected in a small way, and in the country between Boca de Quadra and Portland Canal gold-bearing quartz ledges yielding rich specimen rock have been discovered.

A few prospectors have been up the Unuk river, a considerable stream entering the head of Behm Canal. The country is reported by them to be exceedingly difficult to get about in and prospect. They have, however, found placer gold and some exceedingly rich silver-bearing lodes. So difficult and comparatively remote is this locality that no attempt has been made to develop anything.

Helm Bay, off of Behm Canal, on the Cleveland Peninsula, 24 miles by water from Ketchikan, was the first point in the Ketchikan district to receive fairly close prospecting and actual productive mining development. The Helm Bay area is inclusive of the southern end of the Cleveland Peninsula, taking in mineral discoveries on Union Bay and Vixen Inlet. At Helm Bay proper the developments are of gold-bearing quartz entirely, and are all on the south side of the bay. The country rock formation is diabase, locally altered to serpentine in places and bounded by serpentine on the west. Close to the shore of Helm Bay, and having the prevailing N. N. W. and S. S. E. strike, is a narrow belt of chloritic schists carrying gold-bearing pyrite in knife-blade quartz seams. The body of this material is large, but the grade low, assays showing from \$1 to \$2.50 a ton in gold. In the diabase there are recognizable two distinct quartz vein systems. One of these consists of a series of parallel veins transverse to the rock formation strike and dipping without uniformity of angle to the north. The first discoveries of gold were made in these veins where they were exposed between high and low water mark. The gold is set in the quartz coarse and nuggety and is easily seen among the barnacles and mussels. The quartz, being more resistant to erosion than the enclosing rocks, has been left in relief by tidal erosion. Inland explorations on these veins have developed some pocket deposits, but no ore in milling quantity. The ledges vary from 12 to 60 inches in width and are quite irregular. Galena, mispickel and tellurides have been recognized in some of the ore. The other quartz vein system strikes at right angles with the one described and dips sharply to the east. It is in a system of fissuring running with the strike and dip of the rock formations. These veins are more irregular and have only a distinct foot wall, the mineralization extending out into the hanging wall rock. These veins are gold-bearing, notably so where they cross veins of the other system. The gold is free, occasionally in rich pockets, but forming mill bodies of ore as well. The veins carry pyrite which is rich in gold. The Gold Standard M. Co. own a mine including sixteen claims located on parallel veins of the first described system. Their mining operations are on a vein of the other system. Dyer & Johnson, the original locators discovered in the fall of 1898 a pocket at the surface, from which they took out gold to the amount of \$18,000 in exceedingly rich specimen quartz. The company has put down a 200-foot shaft on this ledge, and opened it by levels. It has a steam hoist and a 10-stamp water power mill with concentrators. The mill is connected with the beach by a 3-foot gauge 30-pound-rail tramway 3600 feet long. The Gold Standard is the leading development on Helm bay and the first in Ketchikan district to have a mill put on it. Notable developments and a moderate aggregate output of gold have been made on a number of other gold-bearing ledges on Helm bay and a 2-stamp mill has been installed on one of the properties by Moran, Charles & Smallwood. This is on the opposite side of the mountain from the Gold Standard. The Keystone mine, J. A. Bradley, superintendent, is being prospected on an extensive scale. The ledge in this mine outcrops boldly on the contact between the serpentine and the diabase. It is about 40 feet wide and carries its gold values in pyrite. The aver-

age grade of the ore is low but the conditions for cheap mining and milling on a large scale are so favorable that it is considered safe to become a commercial proposition. The mineral belt continues northwesterly and at Vixen Inlet a number of prospects have been found. The general character of the mineralization is different, however, from that at Helm Bay, galena, chalcopryite and pyrrhotite characterizing the veins. Work here has not progressed beyond the assessment stage.

Gravina Island is separated from Revillagigido Island by Tongas Narrows. The country rock formations are similar to Revillagigido and the mainland formation in their highly metamorphic character. Siliceous and chloritic schists form the half of the island next to Tongas Narrows. The western half adjacent to Clarence Straits, and including both slopes of the principal mountain range which extends from Dall Head at the southern end to Vallenar Bay at the northern end, is limestone. Both the schists and the limestones contain porphyry eruptives both massive and in dikes, and the limestones in the localities specially mineral bearing are very much faulted.

In the schists the valuable mineral found is gold in quartz veins carrying as a rule very little pyrite. What development has been made on these veins, very little in all, indicates a general direction of strike corresponding to the sheeting of the formations, and dip nearly vertical. The Bell mine owned by Campbell & Co. of Ketchikan, and the Naha mine owned by J. R. Heckman of Ketchikan, are on parallel veins about a half mile apart and 4 miles south of Ketchikan. In both the quartz is laminated and banded in structure, and associated with the quartz as vein filling is talc apparently an altered schist. The veins are strong and wide, 3 to 14 feet. The gold of the ore is largely recoverable by amalgamation, and the remainder in vanner concentrates. The sulphurets consist of pyrite and sphalerite, there being from 2% to 5% of zinc in the higher grade ore. Outside of a rich streak assaying as high as \$50 a ton the milling ore average is low, \$4 to \$6 a ton. The exposure of shoots at the surface indicate commercial qualities of ore. On both claims several prospect shafts have been sunk, the deepest about 50 feet. The two veins briefly described are the most developed of any. Many others prospect on the surface equally well in values and on some, specimen gold quartz has been found.

In the limestone formation the valuable mineral developments are copper, gold, silver and lead in order of relative importance as stated. Discoveries of lodes and prospects have been made at the extreme southern end of the island at Dall Bay and Seal Bay, and at the northern end on the slope of the mountain range toward Clarence Straits. The mountain terminating the south end of the range rises from Dall Bay and Seal Bay. Its upward slope is a series of benches or steps made by vertical fault planes. In fissures made by these faults lenticular bodies of quartz have been found, carrying gold-bearing chalcopryite and pyrite. Many of these are of widths from 20 to 60 feet, others are narrower and more extended in length. The strike of the different bodies has no uniformity. The direction of dip is from the mountain. In some of the fault planes a dike of a basic eruptive, altered to serpentine, occupies part of the fissure and forms one wall of the quartz vein. The veins are very irregular in the quantity of mineral carried, and the average copper per cent and gold content is low. The ore can be sorted by hand and, with the cheap tunnel mining possible, can be made commercially profitable. Considerable prospecting was done during 1899 and 1900, but only assessment work is being done this year. Average ore values can be stated for commercially prepared ore 2% to 10% copper, \$1.50 to \$5 gold and one to five ounces of silver to the ton. The principal developments have been made on the Grotto mine by a company of which W. H. Gilmore of Ketchikan is manager, and on the Dall Head by a Portland, Or., company. The latter operation is temporarily closed down.

At the north end of the island less work has been done. The ore veins carry a somewhat different mineralization. Chalcopryite associated with galena, is characteristic mineralization. The gold and silver values average higher than at the south end. The chalcopryite and other minerals are more evenly disseminated and there is a much lower proportion of pyrite. The ores are commercially concentratable by machinery. On discoveries already made the conditions for mining are hardly as favorable as at Seal Bay. There is less opportunity to get depth by tunneling. The principal work of prospecting—it is not sufficient in amount to call development—has been done by the Hartford Mining Co. of Boston, Mass., A. H. White of Hollis, Alaska, local manager.

Annette Island is a reservation made by Congress for a community of British Columbia Indians who had been Christianized and civilized by the Rev. Wm. Duncan. The settlement of Metlakahla was made in the latter 80's. Congress did not pass the title to the Indians, merely reserved it for the exclusive use and occupancy of this particular community, who moving into the United States were not given citizenship. The area of that island is 125 square miles. The number of Indians in the community is about 500. They actually occupy in only one settlement not more than 2 or 3 square miles. While it was

\*See illustration on front page.

expected that they would make agricultural use of the island they make none whatever. While the island was intended to support them, it is in fact, used for no useful purpose but the site of their town. Many of the Indians are permanently residing at Ketchikan, Saxman and Gravina, and all of them derive their support from working in the mines, lumbering or fishing, exclusively on other islands than Annette, living, working and competing with white men. They are good workmen, and have, organized and going, larger commercial and industrial businesses off of Annette island than on it. To an observer they are maintaining themselves industrially on even terms with the white men. The claim that the exclusive reservation of Annette Island is necessary to protect them against the vices and superior thrift of the whites is not sustained by the facts. They are in continued contact with the whites from choice, maintain equal thrift, and do not acquire the vices. The facts have been stated in some detail because of their pertinence to the mining development of Annette Island. At the time the island was set apart for them the existence of valuable mineral on it was not suspected. The discoveries subsequently made were of gold and silver-bearing ores of marvelous richness. With the non-existence of the reason for the exclusive reservation of the island for the Indians; with no use or occupancy being made of the land by the Indians; with practically an entire failure to accomplish the intent of Congress in making the reservation; with these real facts and conditions what they are; Congress should throw open all of the island except the settlement now occupied by the Indians.

The prominent physical feature of Annette Island is a mountain summit about 3500 feet high east of Metlakatla and occupying the central portion of the island. From its northern end a range of lesser summits extend to the northern end of the island. Among the peaks of the latter are two said to be old volcanic cones. The country rock formation where the mines have been discovered is stated to be a limestone, similar to that characteristic of the Dolomi locality on Prince of Wales Island, described further on. Specimens of ores from the two widely separated points are characteristically identical in mineralization and physical appearance. The discoveries that had been made up to the time when the prospectors were evicted from them and the island, were made on the east coast, the section beginning about 5 miles northwest of Mary's Island and including the coast for 7 miles northward. The prospectors state that they found the area extending from this shore line to the western shore of the island all mineral bearing. The veins are quartz, carrying silver-bearing tetrahedrite and free gold. The percentage of silver in the tetrahedrite would seem to approximate 30% from the figures of partial analysis. Assays showing silver values from 600 ounces to 2000 ounces to the ton are common with ores from this locality. Gold values also run into the hundreds of dollars to the ton, though not in ore with the high silver values. The gold appears to be in the quartz where there is little or none of the silver-bearing mineral. Several prospecting shafts were sunk on different veins and shipments of ore made before the mining was stopped. Nothing has been done on any of the claims since then. The Indians started to mine after the prospectors had been driven away; but, on the protest of the latter, the Indian Department stopped the mining, ruling that there was nothing in the Act of Congress making the reservation which permitted mining.

Dall Island has received some attention from prospectors and a number of discoveries of gold lodes have been made opposite Jackson P. O. Only preliminary prospecting and assessment work is under way on the island at the present time.

Kosciusko Island, like Dall Island, one of the Prince of Wales Archipelago, is commonly spoken of as if it were part of the principal island. The settlement of Shakan is on Kosciusko Island, and not on Prince of Wales Island. At this place there is a large saw mill, a halibut and herring fishery plant, a marble quarry and a gold-bearing quartz mine equipped with a stamp mill. This locality has not been developed from Ketchikan, but from Wrangel. It has been a port of occasional call for Alaska steamers, and is on a local steamer mail route from Wrangel to fishing stations and Jackson, on the west coast of Prince of Wales Island. The marble quarry is being prepared for exploitation on a considerable scale by a Fargo, North Dakota, company, for which M. Cronin is manager. It is less than half a mile from the steamer landing. A plant of marble cutting machinery has been put in place. The quality of the rock is claimed to be superior. It is sound even at the weather exposed surface, and is expected to enter the Pacific coast market in competition with marble brought from Italy in sailing vessels. The gold quartz vein, owned by Castle & Co., was discovered in 1898. It is a wide vein of low-grade ore, most of the values being carried in pyrite.

Duke Island, south of Annette, is uninhabited and has been little explored for mineral values. It is stated that a gold-bearing quartz vein has been found on the island, and also that an outcrop of coal is exposed on the beach.

Wrangell, Zarembo and Etolin Islands are out of the natural prospecting range from Ketchikan and

so far as known have not been prospected from Wrangell as a base. The latter place has never had the same kind of a pioneer class as Ketchikan, men who while sailors and fishermen by trade were miners from opportunity.

Prince of Wales Island is 130 miles long and from 10 to 40 miles wide. Its area is 2650 square miles, and its coast line following it into all the inlets and harbors is not less than 800 miles in extent. Practically all of the island that has been explored has been found more or less mineral bearing. Except in the central section including the region of Kassan Bay and Cholmondelay Sound the exploration has not gone far inland from the coast. The section of the island north of a line drawn west across the island from Tolstoi Bay has not been prospected even along the beaches. In the partly explored portion of the island there are several centers of mine development, each rapidly growing into economic importance. These are, the Kassan Peninsula or Mount Andrew, Hollis, Skowl Arm, Cholmondelay Sound, Dolomi, Niblack and Copper Mountain.

The Kassan Peninsula or Mount Andrew section includes the area between Kassan Bay and Clarence Straits. At the extreme point of the peninsula is the postoffice and small settlement of Grindall. With increasing development on Prince of Wales Island it will eventually become a port for the landing by the Alaska steamers of the traffic for the Kassan Peninsula mines. Three miles northwesterly from Grindall on the Clarence Straits side is the Allison copper mines, and adjoining further northwesterly the Mount Andrew copper mine. Seven miles northwesterly on the Kassan Bay side is the postoffice of Kassan and the Copper Queen group of copper claims. These are the principal mines measured by present developments, but the number of claims of less development and unknown possibilities is in the hundreds.

The country rocks of the peninsula are all eruptives—diorite, quartz-porphry, serpentine, being most in evidence. In the Allison mine the ore is chalcopryite associated with magnetite in a hornblende gangue. In the Mt. Andrew mine, and in the majority of the claims on the peninsula, the ore is chalcopryite, partly massive in seams in massive magnetite, partly disseminated with pyrite in the massive magnetite. At the Copper Queen the ore is chalcopryite, in bunches and masses in the country rocks, and associated with manganese oxide and magnetite in veins. Some large deposits of hematite are reported, which are believed to be the iron capping of rich copper deposits.

At Tolstoi Bay Patrick Clark of Spokane, Wash., is boring in one of these deposits with a diamond drill.

The Mt. Andrew mine is owned by S. Linkenstadter, Henry Bratnober and some London people. The exploration of the property, now in its third year, is in personal charge of the first named. Mt. Andrew is a peak about 1200 feet in elevation. The ore body takes in the summit of the mountain and extends far down the slopes to the north and south. Its width is known to exceed 1500 feet and its length is more than 5000 feet. This exposure of ore is magnetite. In it are numerous lenses of nearly pure chalcopryite from a few inches to several feet in thickness. Much of the magnetite does not seem to contain a trace of copper. Enormous masses of it contain disseminated chalcopryite associated with pyrite. It would seem as if the entire mineral mass could be utilized. Mining is simply quarry work. Done with machine drills, it should cost no more than mining the hard iron ore in the Michigan ranges, \$1 a ton at the outside. Its own gravity will transport it to the water's edge or reduction plant. Pulverized, it can be parted dry by magnetic separators. One product will be clean magnetic iron, which, compressed into briquettes, will be the raw material for the manufacture of iron or steel. The other product will contain the chalcopryite and pyrite, with all the gold and silver in the original ore, titanic iron, silica and other waste. The concentration raises the copper percentage, and gold and silver content to commercially recoverable values. A test of magnetic concentration made with a sample of the disseminated ore containing 3.20% copper, \$1.20 gold and 1.5 ounce silver to the ton produced 80% of magnetic iron and 20% of the mixed sulphides and waste. The latter assayed 15.6% copper, \$6 gold and 7 ounces silver a ton. The magnetic iron showed only a trace of copper and silver.

Hollis is a district of high-grade free-milling gold ores. The first discovery—the Crackerjack—was made by James Bowden, now the superintendent of the mine, late in the fall of 1899. The town of Hollis was started in the spring of 1900, and a large number of other ledges of high-grade gold quartz were discovered that year and this. Hollis has become a business center of considerable importance. It is situated on a beautiful land-locked harbor off of Twelve Mile Arm, a branch of Kassan Bay. It has a store, assay office, hotel and several other business houses. The mines are from 1 to 5 miles back from the town. The country rock formation is metamorphic slate and porphyry eruptives in dikes. The metamorphism of the slates has not produced the hard siliceous schists to which frequent reference has been made. The formation greatly resembles the mother lode formations in Tuolumne county, Cal. The ledges follow contacts of the dikes with black

graphitic slates. Not only the quartz is gold-bearing, but the gold values are carried in the shattered slates more or less mixed with the quartz. Narrow foot wall seams of high-grade quartz that it pays to mortar out at the mine are common. From nine pounds of quartz from a 6-inch streak in the Puyallup mine \$40 was pounded out in a mortar. High-grade ore that will stand shipment has also been developed in quantities in many mines. The first shipment of the Crackerjack mine returned \$225 a ton net after all charges were paid. While the major part of the values are free, the pyrite and mispickel which constitute the sulphurets assay from \$600 to \$1100 to the ton. Well-built trails lead from Hollister back to the mines, and several of the developed properties are building rail trams to enable shipments of ore to be made economically. The milling character of the ore will justify the erection of a number of free-milling plants. There is much ore that will pay well milled on the ground that would not pay transportation and smelting costs.

At the head of Skowl Arm, a branch of Kassan Bay, 2500 feet above the sea level and 2 miles back from the water, is the Khayam copper mine, George McKenzie superintendent. The mine is at the surface a great chimney of chalcopryite ore 600 feet by 400 feet in a hard syenite formation. A tunnel has been driven in opening it up at a depth of 100 feet, and a second tunnel is now being run which will open it 400 feet down. The plans of the company provide for the construction of a wire cable tramway down the mountain to tide water. There are many other locations in the locality but no development work. A discovery of nickel-bearing phyllosilite is reported.

Cholmondelay Sound is an arm of Clarence Straits with many branches, one of which heads within four miles of the head of Copper Mountain Bay on the west side of the island. The portage is a low divide barely above the sea level. A good trail has been built across it to Copper Mountain camp, and it is used as part of the mail and light traffic route from Ketchikan to that place. It cuts off 75 miles of steamer travel around Cape Charcon at the southern end of the island. On Cholmondelay Sound there is a postoffice and small town, Sunnyside. Mining on the land bordering the sound has been largely locating claims and doing assessment work to keep them alive. In only a few cases has there been any planned development work. Discoveries have not focalized to any center, but locations have been made on over a very widely extended area. Copper ores are prominent but galena is markedly abundant. Gold-bearing free-milling quartz has been found and is being developed. The finds are not so far high grade as in Hollis camp. There are many large ore bodies carrying values in sulphides, low grade, but with possibilities of commercial value as concentrating propositions.

Dolomi is the smallest in area of any of the districts. It is a postoffice and small settlement on Port Johnson, a small perfectly land-locked harbor comparable with the harbor at Hollis. The place has a large sawmill, store, wharf and excellent trails and tram roads leading to the mines.

The country rock formation is limestone, generally a clean white crystalline marble. Basic-porphry dikes are intruded into it extensively. It has also been extensively fissured in lines, both with the dikes and across them. In these fissures quartz veins have been formed that are gold, silver and copper bearing. These veins seem to lie in two systems of strike with dips, usually very flat, to the north or east according to the system. The foot wall of these veins is usually free and well defined, though there is no trace of gouge. The hanging wall is invariably frozen. The veins carry free gold, silver-bearing tetrahedrite and pyrite, the latter finely disseminated. So far as a generalization can be made, the veins where highly gold bearing do not carry much silver-bearing tetrahedrite, and where they carry the latter there is little or no gold. Nearly contiguous veins will show, from the one, gold of exceptional fineness, 990 in one case, and from the other, exceptional fineness of silver, equal to that of the gold instance. The gold-bearing veins show no chalcopryite mineralization, but there are some veins showing it which, while they look promising, do not carry commercial values. The limestone of the locality is notably full of caves. These caves in a number of instances follow the veins on their dip and have disintegrated and washed out considerable sections of quartz. The caves go down below the sea level, and indicate that the recent regional movement of the land surface is towards submergence. Possibly it is continuing now. It is a fact tending to sustain a conclusion that the coastal lands are sinking, and not raising, as has been suggested by geologists.

The principal mines of Dolomi Camp are the Valpairaiso and Golden Fleece. The former includes, it is stated, about fifty locations, of which one is being developed. This one, the Valpairaiso, is on the north side of Paul Lake, about 1½ miles from tide water at Dolomi. A plank tram walk, half a mile long, connects the harbor with the lake. Boats are used on the lake and a rail inclined cable tram from the shafts completes the transportation line over which ore is taken from the mine to the harbor for shipment. The Valpairaiso ledge averages 7 feet in width, the 2 feet on the foot wall being high grade shipping rock. A shipment of thirty-five tons taken in sink-

ing two shafts to 40 feet in depth returned \$185 a ton. A third shaft is being sunk at the present time. B. A. Eardley of Pacific Grove, Cal., and others are owners of the mine, and Wm. Buttrick is superintendent.

The Golden Fleece mine, owned by the Golden Fleece M. Co. of Seattle, Wash., A. F. Knight, superintendent, is 1½ miles north of the harbor. It is developed by two tunnels and two shafts, and equipped with a one-stamp prospecting mill, which is kept crushing ore said to pay \$40 a ton. A number of other ledges have been prospected by surface works, cuts and shallow shafts, very generally showing values that justify development. There is a notable identity of characteristic ore between the ores of this district and of Annette Island.

Niblack's Camp is 3 miles in an air line from Dolomi. It includes the peninsula between Johnson Inlet and Moira Sound, and both sides of the North Arm of Moira Sound, including Niblack's Anchorage, a sheltered land-locked harbor off of the junction of the two bodies of water. Between Dolomi and Niblack the country rock formation changes. The limestone gives way to greenstone. The line of contact is close to Dolomi and runs northwest, the limestone covering the head of North Arm and continuing to Cholmondelay Sound.

The valuable mineral of the greenstone formation is copper in chalcopryite. It is gold-bearing, and associated with pyrite and magnetite. In the limestone formation galena appears with chalcopryite in strong veins around the head of North Arm and in the country extending from there to Cholmondelay Sound. The veins in the North Arm locality carry galena, which is absent in the limestone of Dolomi, and do not carry tetrahedrite, which is characteristic of the Dolomi ores. The occurrence of chalcopryite in commercial quantities in the ledges of the limestone of North Arm, and not in the Dolomi section, is another characteristic difference.

At Niblack Anchorage in the greenstone formation a discovery, made late in 1899, of a strong 30-foot quartz ledge carrying chalcopryite associated with pyrite and magnetite, is being developed by a Portland, Or., company. The ore carries from 6% to 8% of copper, \$2 to \$4 in gold and about 3 ounces silver. Several small trial shipments have been made and the work being done is intended preliminary to large scale exploitation. Opposite Niblack, near the summit of the greenstone mountain, occupying the peninsula south of Johnson Inlet, is a 300-foot wide vein, carrying chalcopryite very finely disseminated in a quartz gangue. The ore is similar in physical character to ores at the north end of Gravina Island, except that there is no galena. There is an absence of pyrite in the ore and a rather high average of gold values. The foot wall streak assays about 15% in copper and from \$6 to \$20 in gold, some assays going

much higher in gold. The main body of the ore carries good commercial values. The mine is a quarry, and the ore is almost ideal for concentration by wet methods.

Copper Mountain, or Coppermount, as the post-office is named, is a 3500-foot high mountain alongside of the head of Copper Harbor, an inlet from Cordova Bay, on the west side of the island. It is, however, practically as accessible through the low divide from the head of Cholmondelay Sound as many of the east side mines described. On the mountain, well up toward the summit, there are a number of lodes of copper ore of such great width that they are minable as quarries. The formation is the western extension of the limestone formation of Dolomi Camp. The surface ores are much oxidized and concentrated. Malachite and native copper occur along with chalcopryite, forming ores of shipping grade that go 20% and upward in copper and carry large values in gold and silver. A few miles northwest of Coppermount, in the mountains surrounding another inlet from Cordova Bay, the ledge carries silver-lead ores. Some shipments have been made and have paid, despite very heavy transportation costs and the low price of lead. These lead-silver developments are still in the hands of prospectors, but the copper mines at Coppermount during 1900 and this year have been exploited commercially by strong capital.

Besides the many promising undeveloped claims in locator's ownership yet, three large properties have been created by aggregations of claims. Easily the first of these in development is the original Copper Mountain or Mellen mine, lately sold by the taking up of the development bond the property has been operated under, for it is reported \$500,000, and a fourth interest reserved to and carried by the purchasers for Mellen & Sylvester of Juneau, Alaska, the original owners. The purchasers are Butte, Mont., people, S. I. Silverman of Spokane, Wash., manager. Ore is being quarried out 3200 feet above the sea level and let down by a gravity suspended cable tram to bins on a wharf at Copper Harbor. The slope of the mountain is so steep that the tram line is less than a mile long. The ore is shipped in 100-ton lots without sacking and is reported to return \$65 net a ton after all costs of mining and transportation and smelting charges are paid. The company is putting in a tunnel at 500 feet elevation, which will give 2800 feet depth below the highest outcrop and will cut two smaller veins before the main vein is reached. A large nearby water power has been utilized to operate an air compressor permitting the use of power drills in the lower tunnel.

The Alaska Industrial Co., including Senators J. P. Jones, ex-Senator Pettigrew, Congressman Sulzer and other New York people, is developing an even larger aggregation of claims than the Copper Moun-

tain, under a Mr. Scott as manager.

The Spokane Dev. Co., of which Patrick Clark of Spokane, Wash., is the principal owner, is doing development work on a large scale on the Copper Boy mine. James Harvey is superintendent. There is no difference in the grade or quantity of the ores or the physical conditions for exploitations which should make these last two mines less desirable than the Copper Mountain.

Moira Sound, McLean's Arm, Nicholl's Bay and Hunter's Bay localities have all become known from discoveries of copper or gold ores. None of them have received anything more than the surface scratching of prospectors. Capital has not been so plentiful in the district that it could cover all the discoveries no matter how promising.

The physical conditions which determine the facilities for mining industry in the district are as follows:

The climate is temperate, rather than Arctic. Despite the high northern latitude, there is little severe cold, the temperature rarely going below 10° F. at the sea level. The water in the heads of some of the inlets, receiving considerable fresh water, freeze up in winter for a few weeks sometimes. The temperature on the western side of Prince of Wales Island is slightly warmer in winter than the eastern side, and the latter is two or three degrees warmer than Ketchikan. Work is at no time prohibited by cold. The rainfall, and in the high altitudes the snowfall, is excessive. There is little or no dry weather in summer. Differences of weather can be defined as more rainy or less rainy.

Timber is abundant. The varieties are spruce, red and yellow cedar and hemlock. The trees are large—spruces from 10 to 14 feet in diameter are not uncommon. The yellow cedar is a beautiful grainless wood, too valuable for mining use. Hemlock is too heavy to log to advantage. The red cedar is good for mine timbers. The spruce makes fair common lumber, but is too soft for mine timbers or mill framing. It is a superior wood for pulp making. There is no lack of timber for all prospective mining use.

Coal is reported to exist on Duke Island, in land adjacent to Karta Bay on Prince of Wales Island and on the Cleveland Peninsula near the Yes Bay salmon cannery. The quality is not known. Coal of good quality is found in the north end of Graham or Queen Charlotte Island, about 50 miles south of Prince of Wales Island. It is in British Columbia and would have to pay duty. Its nearness to the point of use would offset the tariff as compared with coal brought from Washington. If it is a coking coal it would be available at a slightly cheaper cost in the form of coke than coke from Vancouver Island. The cost of freight on the latter, 500 miles on the inside steamer route, with return freight of ore or metal, should not exceed 75 cents a ton. This refers to

special colliers like the Great Lake vessels towing barges. Fuel oil from California, 1500 miles outside route in special tank steamers, with return freight of metal, could deliver oil so that it would cost not more than 80 cents a barrel.

The water transportation both inter-island and to Puget Sound can be made exceedingly cheap. The entire western coast of Prince of Wales Island can be navigated in sheltered waters behind islands that may yet prove rich in minerals. There are many safe land-locked harbors on the eastern shore. Other islands are equally favored. At many points where there are no harbors, piers can be built and landings made in fair weather. Most of the mines can have landings at the nearest water. The cost of freight of ore or metal to Puget Sound ports in special steamers can be made as low as \$1 a ton. Rates offered now are as low as \$2.50 a ton, except from Coppermount.

Land transportation has to be solved by aerial cable carriers and trams. Roads and trails, owing to the moist climate, cannot be made any cheaper in installation and cost more to operate. The land transportation by suspended cable can be made as cheaply as anywhere in the world, and about every mine can have a line operating by gravity and delivering the mine products by the side of the open sea.

Water is in abundant supply for ore concentration and power development use. The water plants for power development will be comparatively inexpensive. The streams are short, with high grades. They are fed from mountain snows and can be depended on for from nine months to the full year. Electrical transmission lines can be short. The water power can be anticipated to be as cheaply developed and operated as the best yet made anywhere.

The mining of ores is notably a matter of quarry or tunnel opening. A maximum of machine work and minimum of

Buffalo Exposition Exhibit of "The Lunkenheimer Co."

The exhibit at the Pan-American Exposition of "The Lunkenheimer Company" herewith illustrated is installed in Section 46 in the Machinery and Transportation Building. For visitors to the Exposition, who are interested in brass and iron steam specialties and engineering appliances, F. L. Swanberg, who is in charge of the exhibit,

would be pleased to explain them. There are on exhibition a line of regrinding valves, handy valves, lever throttle valves, pop safety valves, plain whistles, fire alarm whistles, injectors, sight-feed lubricators, oil cups, grease cups, glass cups, glass body oil pumps and brass valves and fittings for marine work in medium and extra heavy patterns. The headquarters of the Lunkenheimer Company are in Cincinnati and they have branches in New York and London.

manual labor is possible. Mining by shafts is about the same proposition as everywhere except that power will be cheaper.

Prince of Wales Island is fairly to be considered a commercial proposition. In the five noted localities in which copper is the leading metal developed and in the two in which quartz gold is predominant, minable values in enormous quantities have been proven. That is to say, the raw material of wealth from minerals exists; the problem is simply the realizing of it at the least cost, all things considered. In a general way it can be stated that any kind of plant can be installed without a single item of extraordinary cost. The maintenance of labor, the cost of living, is cheaper than in any interior mining district in the United States. The cost of transporting production to market can be made the lowest of any district in the United States.

There is at hand the raw material for the building up of an iron and steel industry similar to that lately started at Sydney, Cape Breton Island, on the Gulf of St. Lawrence. Prince of Wales Island has the iron and the limestone, and coal fuel is closer to these than the iron is to the coal and limestone at Sydney. Should there be coal in Karta bay the iron, coal and limestone are together by the open sea. Prince of Wales Island has China for a market at shorter distance and cheaper transportation cost than any competitor, just as Sydney has the transportation advantage for Europe over Pittsburg. The conditions for continuous operation throughout the entire year are much better at Prince of Wales Island than at Sydney.

In the production of copper the mines of Prince of Wales Island and of Ketchikan district certainly have the advantage of the minimum possible costs of mining and ore reduction. The present shipment of ores is a temporary expedient incident to the prospecting of the deposits. The conditions for reduction of the ores at the mines admit of lower ultimate costs than can be gained by shipment. The indications all point to the rapid and enormous development of the copper production.

## Mining and Metallurgical Patents.

Patents Issued August 27, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 681,504; C. Hultquist, Jerome, Ariz.

A cylinder and a piston reciprocable therein, a chest extending approximately same length as cylinder and having a valve chamber at each end, chest having propelling medium intermediate of chambers and common to both chambers, separate inlet and exhaust ports for each valve chamber, connecting directly with cylinder, a valve rod operating in chest and a double valve at each end of rod, and controlling admission of propelling medium to and from cylinder, and connections of ports for permitting propelling medium to pass from front to rear of valves to actuate valve rod.

HIGH-PRESSURE ROTARY PUMP.—No. 681,581; J. Richards, San Francisco, Cal.

A series of separate and separable pump casings, having interior chambers bounded peripherally by circular walls, a driving shaft passing through all chambers in line of axis of their peripheral walls, impervious disk partitions in chambers surrounding

shaft and dividing each chamber into two waterways in communication by means of an annular peripheral passage formed between disk edges and circular wall of chamber, impeller on shaft in one waterway of each chamber, all impellers having suction inlets central and facing same direction, removable annular throatings provided with inclined partitions interposed between impellers at their peripheries and entrance to annular peripheral passages, impellers forming running joints with entrances to throatings, other waterway of each chamber forming a direct communication by shortest path between peripheral passage and inlet of next adjacent impeller, each impeller except first being supported from discharge waterway of adjacent preceding chamber.

AMALGAMATOR.—No. 681,232; E. J. Kiss, Fort Wayne, Ind.

An upright tank having a laterally-extended chamber on one end; a pair of cylinders revolvably mounted one above the other in tank; a driving chain operatively connecting cylinders; a pair of mercury receptacles in co-operative relation with cylinders; a screw conveyor rotatably mounted in bottom of tank and dipping into a body of mercury; an inclined chain conveyor arranged in chamber and adapted to discharge ore from machine; and means for actuating screw conveyor and conveyor chain.

ORE CRUSHER.—No. 681,234; C. H. Krause, South Lake Linden, and H. C. Krause, Point Mills, Mich.

A stamp and mortar for crushing ore and screen through which crushed ore is discharged by splash from stamp, an auxiliary discharge for free metal too large to pass through screen, consisting of conduit leading downwardly out of mortar and water supply connection leading into conduit and adapted to produce an upward current through the same.

COMBINED ORE HEATING, ROASTING AND SMELTING FURNACE.—No. 681,354; S. M. Trapp, Seattle, Wash.

A combustion chamber, a stationary crucible located therein with its top open and its sides free from walls of combustion chamber, a passageway leading from crucible and terminating in tap hole, and forehearth connected with passageway and entirely located within combustion chamber.

HOIST MECHANISM FOR MINE SHAFTS.—No. 681,430 T. J. Barbour, San Francisco, Cal.

In a single-cable hoist apparatus for mine shafts, the endless hoisting cable, of opposing cable cages, devices carried by cages whereby endless cable is guided above and below same, and means whereby cages may be held locked to or released from endless cable without requiring cages to be removed from cable in order to permit of its position being varied in accordance with working level of mine shaft.

ORE CONCENTRATOR.—No. 681,271; P. H. Shue, Ouray, Colo.

A casing having collecting passages in sides, discharge tubes in passages formed with lateral openings, tubes provided with openings adapted to register with openings in discharge tubes working in discharge tubes, mechanism for adjusting interior tubes, and means for actuating mechanism during movement of machine.

FEED BOX FOR ORE CONCENTRATORS.—No. 681,561; J. H. Michelsen and M. L. Borglum, Butte, Mont.

A feed box, rectangular in outline, provided with feed hopper at one end, a row of discharge holes near bottom, series of grooved shelves of different lengths arranged one above the other, each shelf being separated from one of the sides of box by a space arranged alternately on different sides of box.

PROCESS OF GENERATING CHLORINE AND TREATING ORES WITH SAME.—No. 681,059; E. D. Kendall, Brooklyn, N. Y.

Process of treating ores containing precious metals, which consists in subjecting them to action of acid salt, having formula  $\text{Na}_2\text{SO}_4$ ,  $2\text{H}_2\text{SO}_4$  and a chlorine-containing body.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ARIZONA.

#### PIMA COUNTY.

The Arizona Copper Hill M. Co. of Denver, Colo., expect to make a sale of their mine, near Tucson, to another company for \$2,000,000. They have a 68-foot vein of 5% leaching copper ore; and if the sale is made, a large leaching plant will be erected.

N. H. Matas of Tucson has struck a rich body of ore carrying free gold at his mine in the Canada Del Oro district, near Tucson.

N. P. Allen, Supt. Eureka Dev. Co.—a Calumet, Mich., company—is developing some bonded claims near Tucson.

M. Delaney, manager, has started work on the old Spanish mine, above Goldfield. The property is believed to have been worked generations ago by Spaniards. C. Wing of New Mexico is interested in the company, of which J. E. Walker of Tucson is president.

The Oceanic mine, near Arivaca, has begun shipment of high-grade gold ore to the sampling works. The first lot assayed \$180 per ton. The production of high-grade ore is about ten tons per month, the rest of a 2-foot vein extracted being stored pending the erection of a mill. C. R. Wores, owner, is now arranging for a steam hoist and pump of a capacity to sink the shaft 500 feet deep, 200 feet below the present depth, when a mill will be erected. H. R. Bacon is Supt. of the mine.

#### COCHISE COUNTY.

A. C. Siebolt of Denver, Colo., who has a bond on R. Welch's copper claims, near Bisbee, has commenced work under a Mr. Ford of Bisbee as Supt. A shaft is to be sunk 250 feet to prospect the ground.

#### COCONINO COUNTY.

The Last Chance mine and millsite in the Grand canyon has been sold by R. H. Cameron, E. I. Gale, P. D. Berry and N. Cameron to H. T. Barbour, representing Eastern people, the price being \$35,000. Work will begin at once on the mine. C. H. McClure is Supt.

#### YAVAPAI COUNTY.

A strike has been made on the Hammer claim, one of the White Horse Co.'s properties, near Prescott. The ore, which is quartz and hematite, was found in shaft No. 3, and tests made of the value show that it will mill \$100 a ton. Mr. Monroe of New York is local manager.

### CALIFORNIA.

California State Mineralogist Aubrey announces that Bulletin No. 22 is now ready and can be obtained by sending 5 cents to the Bureau for it. It consists of a compilation of the values of all the mineral productions of California in the past fourteen years, and up to Jan. 1, 1901. It shows the increase of the industry during that time, and is intended as a statistical reference book.

#### ALAMEDA COUNTY.

It is reported that Eastern capitalists are buying a large tract of land in East Oakland on which to establish a smelting plant.

#### AMADOR COUNTY.

At the Fremont mine, near Amador City, work is being done in shafts Nos. 2 and 3. A drift is being run from the 640 level of No. 3 shaft to the 700 level in No. 2 shaft. The mine is operated by Goodall, Perkins & Co. of San Francisco.

Mr. Dickerman, superintendent of the Altaite mine at Rancheria, states that the tunnel is now in 412 feet, and is expected to cut the ledge in a short time.

The foundations are completed and part of the framing is up at the new 20-stamp mill at the Keystone mine. The old 40-stamp mill is now running with electrical power from the Standard Electric Co. Supt. W. A. Prichard says that the mill runs a great deal steadier, and the concentrators work better with electrical power than with water.

#### BUTTE COUNTY.

C. E. Kusel of Oroville has sold forty acres of land in the dredger belt near Oroville to J. W. Goodwin. The price is stated to be about \$10,000.

#### CALAVERAS COUNTY.

At the Napoleon copper mine, near Telegraph city, the 300-foot shaft has been cleaned out and timbered. A good-sized body of ore was found at the bottom of the old shaft. This mine has been idle for nearly 30 years, but the present owners, Williams Bros. of Bisbee, Arizona, propose if the ore turn of good quality and sufficient quantity to erect a smelting works at the mine.

Operations at the Arent mine, at Cop-peropolis, have been suspended temporarily,

owing to a failure of the machinery to work the gravel. A stamp mill will probably be put in.

F. F. Carnduff of Biggs, Butte Co., is taking options on some lands in the Calaveras river bottom and buying others between Jenny Lind and Hunt's Landing. A drill will be used for prospecting, and if satisfactory returns are had a dredger will be put on the property.

The Calaveras M., Water & Power Co. has been incorporated at San Andreas. The directors are A. Schloss, C. J. Pence, R. Ostrom, D. Fricot, G. Ostrom and L. Pence. The company has secured large water rights and propose to build reservoirs on sites which have been secured. The company will work the Round Butte gravel claim, bought from Stewart & Doolittle, by hydraulic mining.

#### EL DORADO COUNTY.

The 10-stamp mill at the Mt. Pleasant mine, at Grizzly Flat, is now running. The installing of the new compressor is completed.

#### HUMBOLDT COUNTY.

The Orleans M. Co. of Orleans Bar has finished piping to cut bedrock and repair the flume. It is understood that the season was a very successful one.

#### INYO COUNTY.

A mineral map of Inyo county has been completed by the State Mineralogist and a register of the mines and mineral localities is in preparation.

#### NEVADA COUNTY.

(Special Correspondence).—The Mary Jane drift mine on Fall creek, 9 miles north of Emigrant Gap, has been bonded by Esther, Hyatt & Co. of this place to a local company, who are running a new tunnel and are now in 500 feet. They expect to bottom the channel and find the old King lead, which in an adjoining mine yielded \$800,000 a few years since.

Emigrant Gap, Aug. 30.

A San Francisco company, headed by A. D. Gassaway, formerly Supt. of the West Harmony mine at Nevada City, has bonded the De Noon ground above North Bloomfield, and will open it in a systematic manner. Arrangements have been made with the Derbec Co. for land which will be used for buildings and works. A 5000-foot bedrock tunnel will be run which will tap the channel in the De Noon ground where the Derbec Co. left off. It is expected that the tunnel will be completed in about a year.

The Crystal Lake M. Co. has bought the Hartley mines in Meadow Lake district near Cisco and is erecting a 10-stamp mill.

#### PLACER COUNTY.

(Special Correspondence).—The Red Rock quartz mine, 2 miles from Blue Canyon, has a 10-stamp mill in steady operation on paying mill quartz. The tunnel now has 10 feet of ore in the face. H. B. Wiley is the owner.

The Stockton mine, between Blue Canyon and Towle, has two ledges with ore running from \$6 to \$14 a ton. A road is being built preparatory to putting in a 10-stamp mill.

The Paramount mine at Shady Run is running a 5-stamp mill and supplying it with ore from a tunnel.

The Blue Lead at Dutch Flat, owned by Sacramento people, W. H. Bellows Supt., is running a crosscut through the channel to determine pay gravel values.

Blue Canyon, Aug. 31.

The Girard G. M. Co., which has been running four stamps at their mine near Cisco, has recently added four more stamps.

W. J. Dingee of Oakland is at the head of a company developing quartz claims southeast of Cisco on the American river.

At the Lost Emigrant mine near Cisco the shaft has been sunk 100 feet. The last shipment of ore returned \$135 per ton.

#### RIVERSIDE COUNTY.

R. P. H. Laney of Picacho and Ehrenburg is interested in a new gold and copper find opposite Ehrenburg and about 27 miles west of the Colorado river. The ore is rich in gold and copper. The outcroppings covers thirteen claims. Laney and his associates, F. Guerra, J. E. Carl, J. S. White and S. Temple are making arrangements to do development work.

#### SHASTA COUNTY.

The Midas M. Co. has been sued by J. Ceumbs, W. R. Bigelow and M. C. Jordan, who claim to be prior appropriators of the water of Brown's creek, which the company also claims. The suit is for this water. J. H. Roberts of Sacramento is president of the Midas Co.

It is reported that the Balaklala M. Co., near Kennet, had made a new strike in the mine in a tunnel Supt. Ellis has been driving to prospect a new piece of ground. The new body of ore is said to carry a high per cent of copper and a big value in gold and silver.

E. Holden and R. J. Jennings of Redding have bonded for a year at \$1500 the

copper claim belonging to C. F. Daugherty and L. M. Lane. The claim is located on Mears creek, 3 miles from Sims.

P. M. Moore and R. Smith have sold six claims on Minnesota mountain, adjoining Bully hill, to F. H. Kline for \$8000 cash. These claims were worked years ago, then abandoned and recently relocated. The tunnels had been run and the locators, Moore and Small, had done practically no development work. Kline bought for Leadville, Colo., people.

#### SISKIYOU COUNTY.

A copper ledge has been discovered on the western side of Siskiyou mountain, about 8 miles from Garretson's medical springs, 22 miles from Oak Bar, 5 miles south of the Oregon line of Josephine county, and 24 miles from Jacksonville, Oregon, the nearest supply point. The ledge is reported to be from 300 to 350 feet in width. The location is upon a tributary of Elliott creek, extending southward from the Oregon boundary. A branch railroad will be needed in the operation of the mine.

#### TRINITY COUNTY.

Mrs. A. L. Dean of Redding and T. Morton have given a working bond on their placer mine near Trinity Center to W. C. Werick for one year at \$4000.

The lower works of the Altoona cinnabar mine at Altoona are all being gutted out, the machinery pulled up and the bunches of ore left in the upper levels are now about all worked out. It is reported that the property will close down. The company is arranging to buy from J. Conant the ledge of gold ore on Scott mountain for \$20,000. The company is also bargaining for another large claim in the same section belonging to J. M. Waller. The machinery from the Altoona mine will be moved to Scott mountain if they buy, and a milling and cyaniding plant will be erected. J. Porter is Supt.

The Yellow Rose of Texas, at Carrville, owned by G. L. Carr & Co., is producing a gold brick every month from the milling plant on the mine. Mr. Carr states that a 1000-foot tunnel will be started to cut the ledge down about 520 feet from the surface, and, if the ledges struck, another mill will be added. Ten men, under Foreman J. C. Boddiker, are employed.

#### TUOLUMNE COUNTY.

Bacon Bros. have bonded for two years the Wild Cat mine near Sonora. T. Munk is superintendent.

The lower shaft, 250 feet deep, of the old Soulsby mine, at Soulsbyville, is being unwatershed preparatory to active work. The machinery is being repaired.

The Tuolumne River M. & P. Co. has been incorporated with a capital of \$200,000 and office at Los Angeles. The directors are L. M. Gregory, R. B. Dickinson, E. B. Landt, H. V. Carter and S. V. Landt. The company has bought the Phillips mine, near Sonora.

At the Eagle-Shawmut mine 250 men are employed. The machinery of the hoist has been set up. An incline tramway is being built from No. 2 shaft to the 100-stamp mill, now under construction.

#### YUBA COUNTY.

The owners of the Miller mine, near Forbestown, will erect this fall a 20-stamp quartz mill which they have obtained from the owners of the Banner property.

### COLORADO.

#### CHAFFEE COUNTY.

Minneapolis parties, with G. Falconer as manager, have taken a three years' bond on the Old Troy mine, near Granite. A large body of concentrating ore has been opened up and a new mill installed, which has since been increased to twenty tons daily capacity.

#### CLEAR CREEK COUNTY.

R. M. Stearns of Syracuse, N. Y., secretary and treasurer of the General Hooker M. Co., states that work will be started on the 800-foot tunnel to cut the Pickwick vein on Saxon mountain, Georgetown. J. Carroza will be foreman at the mine.

H. L. Tournay, representing Philadelphia people, is getting the Jack Rabbit mine in shape to resume operations. The Little Superior G. M. Co. has bought the mine and will begin sinking and drifting.

#### DOLORES COUNTY.

(Special Correspondence).—The Pro Patria M. & M. Co. owns a group of properties on the northwestern portion of Enterprise hill, at Rico, which is being developed under the management of W. J. Scoutt. A crosscut tunnel has been driven 2370 feet, which cuts twelve of the Enterprise system of veins that stand vertically and trend from northeast to southwest. One of the principal of these veins is the Jumbo Third, which this tunnel cuts 2356 feet from the entrance and 1100 feet below the surface. Drifting on this vein is now in progress. This same vein on the Enterprise group has been opened about 4000 feet. About 310 feet above the

Pro Patria tunnel level is what is known as the Enterprise contact. The ore from the Jumbo lead consists of a lead, iron and zinc sulphide, the values in their order being silver, lead, gold and zinc. The lead runs 15% to 30% and the zinc about as high. Mr. Scoutt estimates the ore to run from \$22 to \$30 per ton. A Leschen tramway is being erected from the tunnel, down through the town, to a point near the railroad, where a concentrating mill is being erected. The tram line will be 3800 feet long, built on a 15% grade. The mill will be equipped with crushers, rolls, screens, jigs, grinders and tables. The principal lead values will be saved as a jig product. The iron and zinc tailings from the jigs will be reground and roasted to magnetize the iron; then the iron and zinc in this roasted product will be parted by a magnetic separator. The jigs will be of a type made in Joplin, Mo. The mill will be driven by a Hug water wheel and will approximate 100 tons capacity per day.

Lacy & Dewey have a lease on the old concentrator at Rico and are running it as a custom mill. It has crushers, jigs and tables and makes lead, iron and zinc products.

The Rico M. & M. Co. are developing and operating the Atlantic Cable group, which includes ground on both sides of the Dolores river at Rico. The property also includes an ore-dressing and separating mill, which the company is operating with electric power. Most of the mine work is through a 460-foot tunnel, running easterly from the mill level, disclosing considerable of a deposit, apparently in blanket form, of a body of iron, zinc and lead ore, ranging from 8 to 10 feet thick and possibly 75 feet wide. The mill makes a zinc product that carries less than 1% lead and less than 4% iron. The lead product is also very clean. The equipment comprises twenty stamps, six Wilfley tables, a roaster and Dr. Campbell's magnetic separator. The heavier material from the stamps passes to two tables, the lighter going to a third table through hydraulic settlers. The tailings from these three tables are reconcentrated over three similar tables. The result of this table work is a pretty clean lead product and another product carrying the zinc and iron in uniform mass. The latter passes to the roaster, by which the iron is changed to magnetic, the separator making partition of the iron from the zinc. The mill will handle fifty tons of ore per day. L. D. Mather is manager of the Rico M. & M. Co., with E. B. Green in charge of the mill.

D. Swiekhimer is continuing development work on Telescope mountain, having recently shipped seven carloads of lead carbonate ore. He also continues his development on the opposite side of the gulch.

Rico, Aug. 29.

#### GUNNISON COUNTY.

The Matchless mine, near Tin Cup, is showing a 6-foot vein with ore which runs from 50 to 150 ounces in silver and 20% to 30% lead. H. Smith of Tin Cup and J. Brough & Co. of Boulder are operating this mine.

The Detroit M. Co., I. L. Johnson manager, has taken the Tin Cup mine on Gold hill, Tin Cup, and is doing development work. In a crosscut on the vein 4 feet of good ore is showing which goes as high as 50% lead. This mine has not been worked since 1893 until now.

#### PITKIN COUNTY.

F. Osborn, manager for a company of Twin Lakes people, has commenced development work on its mines near Aspen.

#### SAN JUAN COUNTY.

(Special Correspondence).—The North Star mine, on King Solomon mountain, has been acquired by the Contention M. Co., whose stockholders are practically the same as those of the Smuggler-Union M. Co. at Telluride. The North Star is an old property, which was extensively and profitably worked for years. In its best days it produced some very high-grade silver-lead ore. It is opened by a system of tunnels and levels, which cut into the mountain at various points from near the apex down the mountain sides several thousand feet. The highest level is about 13,500 feet altitude, and there is considerable open-cut work at a point on the summit nearly 14,000 feet above sea level. This mountain and its mine are accessible on three sides—from Silver Lake basin on the south, Cunningham gulch on the east, and Giant basin on the north; The new company, under the management of G. E. Collins, has commenced erecting an aerial tramway from the fifth level entrance, above Giant basin, to the Animas river, a distance of nearly 13,000 feet. The difference in altitude of the upper and lower terminals will be about 3500 feet. The work of erecting a 100-ton mill at the Animas fork has also been commenced. Much new work has been laid out in the way of opening the

old mine's ore bodies at lower levels. The ores vary a great deal. They include galena, gray, yellow and pyritic copper, the highest silver values being in company with the gray copper. In other portions, where the latest work has been done, there is found an increase of the gold values in black pyritic quartz.

R. C. Tooke has control of the Valley Forge group, on the southern slope of Tower mountain, which includes six claims. Within the present season seven carloads of ore have been shipped, which showed a lead-copper base, carrying about one-half ounce gold and twelve ounces silver to the ton. This production has been incidental to the development in progress.

The Kendrick-Gelder smelter is operating on about 125 tons of ore per twenty-four hours, producing about a 50% copper matte, containing values in gold and silver. The copper value stands first, the gold second and silver third. This plant does not buy any of the lead ores of the district, confining its work to the copper-iron ores, which carry a fair valuation in gold and silver. The ores they get from the Henrietta, for instance, contain about 20% iron, much of other ores bought running about 10% iron. These ores generally run from 20% to 70% silica and 20% aluminum—that, is they make a slag that carries that much alumina.

The Four Metals is near the head of Bear creek that forms one of the headwaters of the Rio Grande. Development consists of a 350-foot tunnel on the strike of the vein. The ore is a calaverite, running high in gold. A number of tons were packed to Silverton for shipment.

The Gold Bug, in same locality, recently produced nine sacks of ore that sold for \$4900. Work on the group amounts to 800 or 900 feet. Mike Coghlan is manager.

The Good Hope, owned by Denver men, has been considerably opened up, but is not working now.

The Kaukaakee, comprising three claims, is developed by 175 feet of work. It belongs to Joe Frank, Frankenburg, Nance and others. The Bonita also has some development. All these Bear creek properties are at an altitude of about 12,700 feet.

Silverton, Aug. 23.

#### SAN MIGUEL COUNTY.

The Gold Run Extraction Co., owning large acreage of placer and tailing dump ground below Pandora, are operating their cyanide plant on impounded tailings which came from the mills above. They are running about 200 tons daily, recovering about equal values in gold and silver. They make a cleanup every fifteen days. The property belongs chiefly to Stephen Peck.

(Special Correspondence).—The Liberty Bell mill at Telluride is treating 220 tons of ore daily with sixty stamps; and Supt. Chase expects soon to be operating eighty stamps on 300 tons per day. This mill involves stamps, plates, concentration and cyanide work and was fully described in this paper in September, 1900. The principal saving is on the plates, the cyanide work coming second and concentration third. At the mine the plant has been doubled this season.

S. T. Elliott & Co. are operating a 15-stamp mill on the old Sheridan dump in Marshall basin. They have shipped six cars of concentrates.

The Special Sessions is on the Elk creek side and the Silver Pick mine on the Bear creek side of a spur from Mt. Wilson descending toward the San Miguel river. The mineral belt, on which both groups are located, has a northeast and southwest trend, carrying an iron, copper and arsenical sulphide ore, with large streaks of quartz carrying free gold. Special Sessions, which is managed by E. L. Davis, is opened through two tunnels, which are connected. From the lower tunnel level an upraise goes in ore 150 feet to the surface. Drifting on the vein aggregates 1200 feet. Smelter certificates of shipment returns show the ore to carry 36% to 40% silica, 16% to 20% iron, 3% to 4% copper, and an average of about seven ounces silver and 2.93 ounces gold to the ton. It is an ore well suited to amalgamation and concentration. The Sessions comprises six lode claims and 160 acres of placer ground on Elk creek, where there is heavy timber. The lode claims are at an altitude of about 12,000 feet. The Silver Pick, on the opposite side of the spur, is higher. The latter property has not been operated this year.

Telluride, Aug. 30.

The Telluride Power Co. is driving a 3000-foot tunnel through a spur of Sheep mountain by electric drills to tap Lake Hope and convey its water into a tributary of Trout lake.

#### TELLER COUNTY.

The Zenobia G. M. Co. has started the largest shaft in the Cripple Creek district. It is to be 6x16 feet clear and will be sunk to the 300-foot point rapidly.

The first practical demonstration of the

use of fuel oil in the Cripple Creek district is to be made by the Stratton's Independence Co. Recently another battery of boilers was installed, and it has been decided to use oil in them for steam purposes. It is claimed that a saving of from 25% to 30% over the cost of coal will result.

The Gold Bond Co. at Cripple Creek has given a two years' lease on the main workings of the mine to G. Bent.

The Nabob Co. have installed a steam plant on the Seven-Thirty claim, on Bull hill, Cripple Creek.

The Isabella mine, Cripple Creek, it is said will be soon sold to the Venture Co. of London.

The gold output of the Cripple Creek district for August in round numbers amounts to \$2,700,000, as compared to \$2,100,000 for July. This is the largest output ever made in the Cripple Creek district during a single month. The railroads have found difficulty in furnishing cars for the transportation of gold ore and miners have been hard to procure. With no interruption September will undoubtedly make a record of \$3,000,000, as every mine in the district is outputting strong.

An important development has been made in the Elkton mine at Cripple Creek, which is expected to determine the plans of the management to erect a mill on the ground, namely the opening of very large bodies of \$20 to \$40 ore in the Raven dike in the fifth level of the mine. The opening of the dike reveals a quantity of low-grade ore in addition to that which will run as high as two ounces; and there are already opened up in the mine great reserves of ore which are of a grade too low to treat at distant mills. In addition, it is estimated that the dump contains at least 200,000 tons of \$10 ore. The management has decided to hold it against the time when it can be handled on company account in its own mill.

#### IDAHO.

##### IDAHO COUNTY.

H. H. Bole of Lewiston has sold a half interest in the Orion mine, near Pierce City, to the Ohio & Idaho M. & Dev. Co., composed of Cleveland, O., people, for \$10,000. Other owners in the property are F. J. Boston, J. A. Gill, R. A. Langford and P. E. Stockey. The property has been developed considerably and a large body of ore been exposed, carrying high values in free gold and silver. A shaft will be sunk to a depth of 200 feet.

##### BOISE COUNTY.

Operations are to be resumed at the Lucky Boy gold mine near Idaho City. It is probable a new shaft will be sunk and new ground explored. The mine has a 20-stamp mill.

##### MONTANA.

##### FLEATHAM COUNTY.

At the B. & B. mill, West Fisher, Supt. Blackwell, the ground is being sluiced away for an addition to the mill of ten stamps.

##### GALLATIN COUNTY.

McCoy, Kirk & Kline will erect a mill to treat the output of their corundum mines near Bozeman.

Walker & Badgley, who are developing a copper mine near Springhill, have run a tunnel 190 feet, disclosing a vein about 20 feet wide.

##### LEWIS AND CLARKE COUNTY.

A cyanide plant is being built by Madden & Sullivan upon the Sunrise mine, near Winston. It will consist of rolls, amalgamating tables and cyanide tanks. The Sunrise is the oldest property in the Winston district, having been worked first in the '70s by Small & Rogers, who still own it. It is developed by one 400-foot tunnel and several shorter tunnels.

##### MADISON COUNTY.

E. H. Wilson and associates of Butte have bonded the Coal Creek placer, near Red Bluff, of 160 acres, owned by A. W. Tanner, and are preparing for next season's hydraulic mining. It contains gold, garnets and corundum, the quantity of the latter being between thirty and forty pounds to the cubic yard of gravel.

Moffett Bros. are in 200 feet on their tunnel on the Quincy mine, near Sheridan, and expect to strike a large body of copper ore.

##### SILVER BOW COUNTY.

In the report of General Manager Klepetko of the Boston & Montana Co. at Butte, for 1900, made to the Board of Directors of the company, he says: "Regardless of the fact that extraction this year has been the largest in the history of the mines, the ore reserves have been increased by 200,000 tons, and aggregated 2,700,000 tons on January 1, 1901. Having the requisite capacity to treat low-grade ores, and the price of copper being at a point to allow the mining of these low-grade ores profitably, it is the intention to make our product, as far as possible, from

these lower grade ores, reserving the higher grade ores for future mining and treatment, when the price of copper may not be so favorable." The report of the directors shows that during last year the total receipts of the company were \$13,242,576.64, all from the output of copper, silver, gold and bluestone. The net income aggregated \$8,161,383.99 and the total expenses \$5,049,724.46. Among these expenses were those at Great Falls and Butte, including the electrolytic refining, \$4,241,895.84, and handling copper, such as freight, copper charges and commissions, \$807,828.62.

#### NEVADA.

##### HUMBOLDT COUNTY.

J. Taylor of Mill City has shipped a carload of 80% antimony ore to New York. The mine is situated in Bloody canyon, about 14 miles from Mill City.

##### WHITE PINE COUNTY.

The Saxton mine of the McKinley property at Ely is being developed and a large area is being stripped. It is the intention of Manager W. N. McGill to sink a shaft, going down to a depth of 200 feet or more before beginning to drift.

#### NEW MEXICO.

##### GRANT COUNTY.

The International M. & Dev. Co. has been incorporated by O. A. Phelps, H. E. N. Phelps, C. F. Dunn, L. A. Milliken, W. Watson, L. B. Robinson and D. C. Harrington, who are also the directors. The office of the company is at Silver City, and capital is \$1,500,000.

The Phelps-Dodge Co., who have a bond on the Beaver-Bolton properties at Fierro, have their new double compartment shaft down 80 feet.

T. W. Carter has bought from N. C. Rascom the Copper Gulf claim at Burros.

M. Hughes, contractor on the Dawson lease on the Anson S mine at Fierro, has struck a body of ore which he estimates will go 12% in copper. A carload shipment has been made to the smelter.

#### OREGON.

##### BAKER COUNTY.

A. J. Tadlock has struck a ledge of free gold ore on his two claims near Sumpter. Assays of surface rock show \$40 to the ton. It is reported that the property will be bonded at \$85,000 to Pennsylvania people.

A rich strike of free gold ore has been made in the Collateral ledge of the old Virtue mine at Baker City on the 400-foot level. It is said that the find is a very large one, and ten stamps of the mill are crushing the new ore.

The California Mountain Con. M. Co. is building a concentrating plant addition to its stamp mill. There are fifty men employed by the company.

##### JACKSON COUNTY.

G. Cottrell, who discovered what was supposed to be a ledge of coal in Section 4, Township 38 S., Range 2 E., three years ago, is doing development work, associated with H. W. Jackson and C. W. Baker of Ashland, and the discovery now proves to be asphaltum, the outcroppings of which have become hard and brittle by oxidation. This deposit is about 400 feet long, 60 feet wide, and dips east between beds of sandstone and shale.

#### SOUTH DAKOTA.

##### CLARK COUNTY.

Deadwood people have organized the Edna Exploration Co., capital \$50,000, to develop the old South Dakota Co. ground, near Garden City. There is considerable cyaniding ore blocked out at the present time. S. Burns of Garden City is manager of the company.

##### PENNINGTON COUNTY.

J. K. Vanatta, the president of the Spearfish M. Co., states that new rolls and screens have been put in the mill and the higher extraction of gold by finer crushing and sizing has already paid for the additional machinery. The track has been laid from the mine to the plant.

The Gertie M. & M. Co., capital \$1,000,000, has been organized by E. C. Johnson of Hill City and others to work 157 acres of ground at Hill City containing a ledge of tin ore, which it is claimed averages about 3½% tin. This tin ledge is 5 feet thick and it has been sunk upon over 400 feet, with levels every 100 feet. Parallelizing this tin ledge is a 5-foot ledge of free milling ore which runs about \$9 per ton gold. The company proposes to erect a mill this fall. A steam hoisting plant will be put on the mine at once. E. C. Johnson is secretary and general manager at Hill City.

The Lacota G. M. & R. Co., in which W. E. Burchinell of Denver is a large stockholder, has opened a 12-foot vein of ore 70 feet below the surface in a shaft on the Grizzly Bear, near Hill City. Four feet of the ore is free milling and assays

\$8.50 gold to the ton. There are sixteen claims in the group now owned by the new company.

#### UTAH.

##### IRON COUNTY.

The Sunnyside M. Co. at Stateline will erect a leaching mill to work the gold and silver ore.

The Johnny M. Co. of Stateline is said to be arranging for the enlargement of its mill.

##### SUMMIT COUNTY.

A test run has been made at the Silver King sampler at Park City by Foreman Fleming. Mr. Fleming took 165 tons of ore and after calling out all the employees went into the mill with one assistant, and in just three hours and thirty-seven minutes from the feed gate the 165-ton lot had been run through and sample delivered to the assay office. No one was in the mill except Mr. Fleming and Mr. Steele, and no other assistant was called in to do the work. The Silver King is also making an addition to its mill by a building 84 feet by 48 feet to carry the rotary drier, filter presses, air compressors, air receivers, tanks, etc.

##### WASATCH COUNTY.

The Pearl S. M. Co. has been incorporated, with office at Heber, to operate the Pearl J. C. and Rosebud claims. The incorporators are Hatch Bros., W. Waldon and Mrs. Waldon, W. Harwood and W. Horner. J. Hatch is president and superintendent.

#### WASHINGTON.

##### FERRY COUNTY.

The owners of the Washington mines, located near Hall's bridge, Marcus P. O., propose to run their tunnel 100 feet farther. The Washington is owned principally by F. Ward and C. Brooks of Marcus.

Bedier & Hoefstetter, lessees of the El Caliph mine at Republic, have received \$1336.27 net from 23,670 pounds of ore sent to the smelter. The gross values per ton were \$126.58. The firm is taking out between \$700 and \$800 worth of ore per week with five men employed.

#### WYOMING.

##### CARBON COUNTY.

E. W. Hull of Cripple creek has the contract for hauling 100 tons of ore from the Rambler mine to the Encampment smelter. The smelter will start its furnaces about September 1. A traction engine will be used to haul twenty tons of matte to the railroad and ten tons of coke to the smelter on the return trip.

P. Lee has bought the interest of C. A. Finley in the Finley property near Encampment. The mine has a 170-foot shaft and considerable drifting. A hoisting plant will be put on at once. The Finley is said to have a 12-foot vein, with an average of 8% copper.

It is reported that the Doane or Old Rambler copper mine at Battle Lake has been sold by the Battle Lake Tunnel Site Co. to Chicago people. It is understood that the price was \$2,000,000, a portion of which was paid in cash and the balance in stock in a new company which has been formed to work the mine.

#### FOREIGN.

##### BRITISH COLUMBIA.

G. Aylard of New Denver and N. Gething of Slocan have bought the Gold Viking group, near Slocan, which has been under bond to T. S. Dunbar, representing Portland, Or., men, who form the Viking Dev. Syn. The deal was closed by the payment of \$7500 cash, and the allotment of 15% of the stock in the company to be formed to develop the property. The Viking is a gold property and the ore, while not free milling, is said to be worked on the ground. The work done on the property has shown a quartz ledge to be 20 feet wide.

Stone & Knight of Spokane, Wash., have taken a contract to start work on the Payne mine in the Slocan. Two diamond drills will be put on to prospect the ledge.

This week the Sunset mine, Deadwood camp, has sent out a shipment of 250 tons of ore to the Hall mines smelter at Nelson. A 10-car spur is being put in at the mine, and other preparations for regular shipments are being made.

#### MEXICO.

The Sonora M. & M. Co., C. O'Keefe president, is operating mines situated in the district of Altar, municipality of Tututama, State of Sonora, about 50 miles northwest of the Sonora Railroad. La Fortuna is the principal claim in the group of eight, all gold and silver-bearing. The silver ore will be treated by the hypophosphite process, under H. G. Glorie, chemist, who will superintend the erection of the plant.

Personal.

THERE are three letters at this office for "Rex."

F. WOOD of San Francisco is sojourning at Juneau, Alaska.

W. P. O'MEARA of Salt Lake City, Utah, is in Tonopah, Nev.

J. T. FINLIN of Butte, Mont., is examining copper mines at Milford, Utah.

A. C. GARDE, manager of the Payne mine, Slocan, B. C., is in Montreal, Canada.

C. H. HENRY has resigned as Supt. of the Bluestone copper mine, near Yerrington, Nev.

E. S. BRADOCK, manager Wilbur-Womble mine, near Hodson, Cal., is in New York.

C. R. DOWNS, C. E., of Sutter Creek, Cal., was in San Francisco for a few days this week.

J. RINLEY of Park City, Utah, has returned to that place from Dawson, in the Yukon country.

W. H. W. HAMILTON is manager of the Owl & Elephant mine, near Sumpter, Baker county, Or.

C. H. MCCLURE has been appointed Supt. of the Last Chance mine in Cocino county, Arizona.

W. J. BALFREY has been appointed superintendent of the Summerville Hy. mine at Cecilville, Cal.

W. F. SNYDER has returned to Salt Lake City, Utah, from an examination of some California mines.

examine some lately discovered gold deposits.

D. H. JACKSON and his son Clyde have returned to California from a prosperous sojourn in Nome, Alaska.

A. J. McMILLAN, managing director of the Snowshoe gold and copper mine at Phoenix, B. C., has returned to that place after several months' absence in London.

W. F. ALDRICH, former secretary of the Parke & Lacy Co., latterly acting consul general U. S. at Hongkong, is associated with the Globe Engineering Co., San Francisco.

Recently Declared Mining Dividends.

Commercial Paragraphs.

THE Potosi Mining Co. of Chihuahua, Mexico, have placed an order with the Denver, Colo., office of the Allis-Chalmers Co. for a 24"x48" first-motion, double-cone drum hoist. The brakes, reverse gear and friction clutches will all be operated by auxiliary air cylinders.

THE S. Morgan Smith Co. of York, Pa., have lately supplied the Floriston Pulp & Paper Co., Floriston, Cal., with horizontal shaft McCormick turbines operating under 50 feet head, developing 4700 H. P., which are used for driving machinery in its pulp and paper mill. Also, the Walls Walla Gas & Electric Co. a single 27" McCormick turbine, which operates an electric plant under 90 feet head; the Boston & Montana Con. Copper & Silver M.

Co., Great Falls, Mont., a pair of horizontal shaft 54" McCormick turbines, developing 2800 H. P.; the Washington Water Power Co., Spokane, Wash., two pairs of McCormick turbines in iron cases on horizontal shafts, each pair developing 1800 H. P. under 68 feet head; Oregon City Mfg. Co., Oregon City, Or., pair of 36" in iron case on horizontal shaft; Willamette Pulp & Paper Co., Oregon City, Or., a pair of 36" mounted in a similar manner; Crown Paper Co., Oregon City, Or., six horizontal shaft McCormick turbines in iron cases; the Missouri River Power Co., Helena, Mont., seven sets of horizontal shaft McCormick turbines of 7000 H. P. capacity.

Catalogues Received.

H. Williams & Co. of 9 to 31 Richards St., Brooklyn, N. Y., have issued a catalogue and price list of their specialties in the metal manufacturing line. It contains descriptions and cuts of drop forgings made of iron, steel, copper, bronze and aluminum, little things all of machines, but many of them important parts of big things in machines.

The Colorado Iron Works Co. have issued from their offices at Denver, Colo., two attractive catalogues, "Stamp Milling Machinery Catalogue, No. 6," and "Some Details as to Smelting Practice and Equipments." Both publications give, in addition to descriptions of the appliances, much useful practical information relative to their use.

The Jeffrey Manufacturing Co. of Columbus, Ohio, has sent out a handsomely illustrated catalogue of the many types of electric locomotives manufactured by them for special mining use. In addition to the more or less familiar mine locomotive taking power by a trolley, there is a storage battery mine locomotive illustrated that is somewhat of a novelty.

The Denver Engineering Works Co., Shepard & Searing, of Denver, Colo., have issued a number of bulletins, each dealing with a special machine or mechanical operation for which it offers the choice of several machines. The bulletins deal with electric hoists, the improved Cammett concentrator, sample grinder, mine timber framing machine, standard crushing rolls and standard re-crushing rolls. In each is given the results of experimental tests and other pertinent information.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING AUGUST 27, 1901.

681,383.—PISTON PACKING—W. H. Alison, S. F.

681,430.—HOIST—T. J. Barbour, S. F.

681,397.—LAND ROLLER—F. A. Bruckman, Plainview, Or.

681,432.—GUN—H. Carr, S. F.

681,612.—SCISSORS, ETC.—S. Clegler, S. F.

681,668.—SPRAYING TREES—J. M. Clark, Lompoc.

681,441.—ENGINE EXHAUST—W. L. Corson, S. F.

681,407.—OBTAINING SALT—P. H. Coward, S. F.

681,496.—CART—W. A. Cowley, Benicia, Cal.

681,458.—TELEPHONE RECEIVER—Cox & Reed, Portland, Or.

681,332.—FRUIT GATHERER—C. J. Eddy, Seattle, Wash.

681,300.—PIANO PEDAL—J. A. Ellwell, Seattle.

681,392.—PISTOL HOLDER—L. E. Fugate, Seattle.

681,501.—TIRE SETTER—O. Gamas, Wallace, Cal.

681,325.—HANDLE BAR—J. Hult, Hood River, Or.

681,594.—ROCK DRILL—C. Hultquist, Jerome, Ariz.

681,433.—PIPE COUPLING—H. L. Jordan, Santa Paula, Cal.

681,332.—MUSIC LEAF TURNER—W. V. Morrow, Los Angeles, Cal.

681,576.—MOTOR CARRIAGE—A. S. Parsons, Berkeley, Cal.

681,458.—MATCHER HEAD—W. W. Philbrook, Seattle, Wash.

681,433.—MATCHER HEAD—W. W. Philbrook, Seattle, Wash.

681,581.—ROTARY PUMP—J. Richards, S. F.

681,354.—FURNACE—S. M. Trapp, Seattle, Wash.

681,594.—AGRICULTURAL MACHINE—D. K. Uall, St. Johns, Ariz.

681,362.—VENEER MACHINE—W. W. Wood, Tacoma.

39,990.—DESIGN—W. R. Smith, Napa, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PHOTOGRAPHIC MOUNT.—No. 680,947. Aug. 20, 1901. P. J. Stuparich, San Francisco, Cal. This invention relates to improvements in the manufacture of photographic card mounts and similar cards in which the surface of the card is tinted. It consists in a method of indenting letters or characters in the plain surface of the card and the tint afterwards applied upon said surface, leaving the sunken characters indented and untouched by the tint.

ROAD CARTS.—No. 681,496. Aug. 27, 1901. Wm. A. Cowley, Benicia, Cal., assignor to Baker & Hamilton, San Francisco, Cal. This invention relates to improvements in the construction of road carts and particularly as to the manner of suspending the body so as to obviate the so-called "horse motion," so disagreeably noticeable in most vehicles of this type. It consists, first, in attaching the shafts directly but pivotally to the axle, and, secondly, in connecting the front of the body by a torsional spring connection to the shaft.

## NOTICE.

Notice is hereby given to all parties not to use, manufacture, permit to be used or manufactured, any device employing the process of the ROBINSON ORE CONCENTRATOR or any infringement thereon, except by legal authority.

INTERNATIONAL MINING CO., H. O. ROBINSON, Inventor. CANTON, O.

## ERICSSON SWEDISH TELEPHONES

Seem to possess almost human intelligence. They respond to every requirement in a smooth, positive fashion that shows what a perfect telephone can do. Besides this they have unequalled strength and durability. Their reputation as "STANDARD OF THE WORLD" is built on merit. Is the best too good for you? ERICSSON TELEPHONE CO. 296 BROADWAY NEW YORK.

## ERICSSON TELEPHONES are strictly "High Grade."

They are sold on their "merits only." Especially recommended for mining work. WRITE FOR NET PRICE LIST AND REFERENCES. WE SELL ANY PART SEPARATE.

## Electric, Railway and Manufacturers' Supply Co.,

PACIFIC COAST AGENTS, 68-72 FIRST STREET, SAN FRANCISCO, CAL.

## FULDA TANK MANUFACTORY AND PLANING MILLS,

30 to 40 SPEAR ST., Bet. Market and Mission, SAN FRANCISCO, CAL.

## NON-SHRINKABLE TANKS, Mining, Water, Oil, Railroad and Wine.

## GENERAL MILL WORK AND MOULDINGS.

We claim the Non-Shrinkable Tank with water channels to be the most perfect in the market. There are two transverse holes all around the tank in the middle of the stave, one near the top and one near the bottom. The staves are all grooved from the top hole to the bottom hole, which insures the filling of water between every stave. This will keep the staves water-soaked without regard to whether there is water in the tank or not, so the oil can be pumped completely out of the tank and left to stand for a period; and when the tank is again filled with oil there will be a tight tank, because of the water in the channels and transverse holes of the staves keeping them moist and prevents leaking. There is no possibility for the water to mix with the oil, because the water can be discharged to whatever place is desired.

In mining tanks there is no loss of solution with these water channels.

CYANIDE PLANTS A SPECIALTY.

MAKE THIS SMALL

## DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes  
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

The
Wilfley
Concentrating
Table

The most satisfactory concentrating table now in use.
It will give better net returns than any other machine.
It will make a satisfactory saving on the finest slimes or will handle
pulp as coarse as 8-mesh to equal advantage.
The Wilfley Table is made only under the personal supervision of the
inventor. It is built right and all possible improvements are em-
bodied in the later machines.

Globe Battery Stem Guide.

PATENTED AUGUST 24, 1897.

RIGID, SIMPLE, DURABLE, EFFICIENT, ECONOMICAL.

No trouble to install. No keys or wedges to adjust. No alteration of mill nec-
essary. Effect a saving in friction losses. Each stem can be removed
independent of the others. Costs no more than wooden guides.

MANUFACTURED ONLY BY

GLOBE IRON WORKS, Stockton, Cal.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilean Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

"DUSED AU'S" FAMOUS ROCKING SADDLE. ENORMOUS SAVING IN ROPE.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Largest Iron Works in the West

Union Iron Works, San Francisco, Cal., Roofed with P & B Roofing.

Roofed
with
P & B
Ready
Roofing

When these buildings were about to be roofed, various kinds of roofings were considered. Tin would not do, because the heat from within would cause it to sweat and eventually rust out. Iron would not do—it would continually contract and expand from the heat beneath and the cold air above, until it would become useless. Furthermore, the fumes and smoke from the furnace and fog and dampness from the bay would cause both the tin and iron to rust and corrode. Slate would become brittle and flake off; tar would run from the heat and fill the drain pipes, besides it would crack in the winter time and allow the moisture to leak through. Shingles would warp and curl and would be likely to take fire from sparks, etc.

So P & B Ready Roofing was accepted as the only roofing that could possibly overcome these difficulties.

This roofing is selected by all concerns who desire a roofing of high character, strength and long-lasting qualities—a roofing that will last as long as the building and never cause any trouble or expense.

Full information about P & B Ready Roofing in our booklet. Send for it. Address Department A.

BROWN'S HORSE SHOE and STRAIGHT LINE ROASTING FURNACES vs PEARCE TURRET FURNACE.

DECISION OF JUDGE HALLETT, UNITED STATES CIRCUIT COURT, DISTRICT OF COLORADO, GIVEN AUGUST 1, 1901.

TO THE MINING FRATERNITY.

We beg to submit for the consideration of parties interested in the treatment of ores, a recent decision of the United States Circuit Court, District of Colorado.

This is a case wherein it is claimed that the roasting furnace known as the Pearce Turret Furnace infringes certain patents granted Horace F. Brown, and, as will be noted, the manufacturers of this furnace, namely, The Stearns-Roger Manufacturing Company, are forbidden from making other furnaces of the Pearce pattern.

The introduction of the Brown mechanically-stirred roasting furnaces have in many instances reduced the cost of roasting ores to such an unusually low figure that wide-spread interest in their performance has been awakened among a large proportion of the mining fraternity.

The great capacity of the Brown Furnaces, their high efficiency, durability, the certainty of obtaining satisfactory results, together with additional features that are characteristic of the type, have tempted other manufacturers to make use of these features in furnaces of their own manufacture, notwithstanding the fact that the essential points of merit are fully protected by letters patent, the validity of which has in every instance been upheld by the higher courts.

The sole right to manufacture the several types of the Brown Roasting Furnaces was acquired by Fraser & Chalmers, and in turn by Allis-Chalmers Company, their successor. We therefore deem it a duty we owe to the mining fraternity to give prompt and due publicity in cases of infringement, and to that end we have recently mailed a large number of circulars giving a recent decision of the United States Circuit Court, District of Colorado, in the case of Horace F. Brown vs. Metallic Extraction Company, wherein the defendants were perpetually enjoined and restrained from making, using, or vending to others the Ropp Furnace or the Ropp Straight Line Furnace, such furnace being an infringement of the Brown patents.

Please note that an acknowledgment of infringement has been made by settlement for a Goodshall furnace, formerly made by Colorado manufacturers, and in use at the Tacoma Smelting Company's works, for which they have paid for infringement.

The apparently insurmountable difficulty on the part of other manufacturers to improve on the Brown type or to produce any new features in furnaces of this character, should be sufficient evidence of the superiority of the Brown Roasting Furnaces.

Respectfully,

CHICAGO, August 12, 1901.

Allis-Chalmers Company.

UNITED STATES OF AMERICA, }
DISTRICT OF COLORADO. } ss.

In the Circuit Court.

HORACE F. BROWN, }
Complainant, }
vs. } No. 4153.
THE STEARNS-ROGER MANUFACTURING }
Co., et al., }
Defendant. }

HALLETT, J. (Orally.) This is a bill to restrain the use of a patent right.

Complainant's patent is No. 471,264, and is for what is called a straight-line roasting furnace. The device mentioned in the patent is for driving rabbles or plows through the furnace to perform a service which was formerly done by workmen moving the ore from doors in the sides of the furnace. As a substitute for the workmen, the first means used was by drawing the rabbles or plows through the furnace by means of chains, moved in a way which it is not necessary to describe, but the machinery thus used was exposed to the heat and dust of the furnace and soon worn out. Complainant's device was to put the power in what he called a supplemental chamber at the side of the furnace and attach the plows to arms extending into the furnace, which moved in a slot in a sort of dividing wall between the furnace and the supplemental chamber.

This patent came before the Court in a suit of the same complainant against the Metallic Extraction Company and was there sustained, and afterwards in the Court of Appeals also sustained, as a useful improvement. In that case the supplemental chamber used by respondents was under the furnace—that is, the supplemental chamber used by respondents was under the furnace and not at the side, and it was held that the circumstance that the chamber was put under the furnace rather than at the side was not material to be considered; the case was within the claims of the patent, whether the chamber be at the side or in some other position in respect to the roasting furnace.

In this suit the respondents' device is different in form and the power is applied from without and not in a supplemental chamber. The patent under which the respondents' claim is known as the Pearce ore-roasting furnace and is No. 488,797. It is circular in form, somewhat in the shape of a wagon wheel, with the periphery as a roasting furnace, and arms corresponding to the spokes of the wheel extending through a slot in the side of the furnace and moved by power at what would be the hub of the wagon wheel. The difference in complainant's furnace and that used by respondents is, that one has a supplemental chamber and the other has not such chamber.

Respondents have sought to show that the supplemental chamber is an essential part of complainant's device, and they have produced a decision made with reference to another patent in the Circuit Court for the District of Washington, which seems to hold that the supplemental chamber is an essential feature of complainant's patent. I have not been able to accept the arguments of counsel in that respect or the decision made by the Circuit Court or the District of Washington.

The inventor of the Brown furnace undoubtedly supposed that the supplemental chamber was an essential feature, because he did not have any means of excluding the outer air from the furnace, and therefore he made the supplemental chamber in which the power could be moved and which would exclude the outer air from the furnace and allow the open slot to be maintained to be traversed by the arms sustaining the carrying plows or

rabblers in the furnace. He sought to put an apron or curtain over the slot, not for the purpose of excluding the outer air but for the purpose of preventing the furnace heat from entering the supplemental chamber. In that he was not successful. His chief difficulty was in maintaining the diaphragm or wall between the furnace and the supplemental chamber which contained the slot in which the arms were moved. At first he failed in that altogether, but by and by was more successful and became, ultimately, able to maintain the diaphragm in pretty good state. As I now recall the testimony, he failed altogether as to the apron or curtain to be carried upon the arms to cover the slot and to prevent the heat from coming into the supplemental chamber. The dominant idea in his construction was to withdraw the power—the apparatus which should move the plows—from the roasting furnace; and he did that by constructing a supplemental chamber in which the power was applied.

The difference between his construction and that of Mr. Pearce is that Mr. Pearce has withdrawn the power altogether from the chamber and has put over the slot in which the arms are moved an apron, which is carried upon the arms, which keeps the slot closed and thus prevents ingress of the outer air into the furnace, which would probably cool it too much.

The difference between the two furnaces is in degree and not in kind. One has withdrawn the power from the furnace partially, the other wholly. Each use practically the same device, except that Mr. Pearce has put an apron over the slot to prevent ingress of cold air, which, in my opinion, is not a matter of invention.

I do not care to discuss the question involved between these patents at greater length at this time, and probably not at any time. The witnesses who have filed affidavits in the case have shown that they can discuss it at great length and present many reasons for one conclusion or the other. To me, or to my mind, the matter all comes in the end to the fact that Mr. Pearce is using substantially the same device Mr. Brown invented. The circumstance that his furnace is circular in form and that he applies the power in a different way is not at all controlling. The patent is one which may be used in various forms of furnaces. The evidence in the former case, and in this case as well, shows that it is used in many forms; in whatever form it may be used, if it is the same as that invented by Brown in the first instance, I think the case is one of infringement.

This is a motion for preliminary injunction, and in particular injunction is asked against the Portland Gold Mining Company, which is under contract with the Stearns-Roger Manufacturing Company for three furnaces which are about to be installed, and perhaps have already been set up. I do not see that it is at all necessary to enjoin the use of those furnaces. Complainant has full remedy in respect to those matters in the way of what may be allowed for royalty in case the patent shall be sustained ultimately, and the only writ which seems to me proper to issue in this case is one which shall forbid the respondents, the Stearns-Roger Manufacturing Company, from making other furnaces of the Pearce pattern. They have had notice from the first of Brown's claim, they were cognizant of the litigation in the other suit, and they ought now to suspend these manufactures until these matters shall be further decided.

Accordingly, we will allow a writ forbidding the Stearns-Roger Manufacturing Company from manufacturing other furnaces of this pattern until the further order of the Court in the premises.

I suppose in this writ there ought to be a bond for, say, \$10,000.00. I am not very well informed as to what the amount of the bond should be.

Given August 1, 1901.

(Revised by JUDGE HALLETT.)

Since the above injunction was granted, Park & Lacy and the Selby Smelting Works have been enjoined by Judge Morrow of the United States Circuit Court in San Francisco, Cal., from the manufacture, sale and use of mechanical roasting furnaces, which the Court holds are infringements upon the Brown patents.

Operator taking courses or horizontal
 angles with BRUNTON'S PAT. POCKET
 MINE TRANSIT.
 If you wished to find the angle be-
 tween two points below the horizontal
 with a sighting compass or an ordinary
 transit, you would first have to set up
 your tripod or staff and then level up
 your instrument. All this takes time.
 If you only wanted to get the angle
 within a degree or so, you could take
 a BRUNTON TRANSIT, and holding it
 in the position shown, take your
 readings in less time than you can
 place any other instrument. Send for
 descriptive catalogue B9 to

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

WATER PROBLEM SOLVED

We solve your mine pumping problems.

Our engineer makes a personal survey of your property. He listens to all your pumping troubles and takes notes of all the things that the old pump won't do.

Then we figure on the conditions. Our long experience enables us to arrive at absolutely correct conclusions.

We submit plans and cost.

If we get the order we build the pump and install it.

If the machine doesn't do the work you don't pay for it, that's all.

We guarantee results.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine.

CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from $\frac{1}{4}$ to $\frac{1}{2}$ greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Boise ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

Prospecting Machinery.

Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything; brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MANUFACTURED BY

ATLAS PIPE WRENCH CO., FLOOD BUILDING, SAN FRANCISCO.
NEW YORK OFFICE, 121 LIBERTY STREET. WORKS, NEW HAVEN, CONN.

The Lunkenheimer "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.

Made with Screw Ends from 3" to 6",
Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely--are heavy and rigid--not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide and other acids. Specify them and order through your dealer. Write for catalog.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Mine Cost Keeping.

The profit that the miner gets from metal that he digs out of the earth is not a gift from fortune. Finding the metal in the earth may be. Reducing it to his possession is a result from labor, both of the hands and brains. The portion of the latter in the partnership is to secure to itself the performance of the largest possible share of the labor and to the hands the least possible share of the labor. It is a most unselfish division, based on the enlightenment of experience. It has been demonstrated by experience that brain labor eats less of production in costs than the labor of the hands.

In mining, as carried on by large capital, with a view solely to profit, this principle in division of labor is in constant use. With the smaller operations of prospectors and of many individual mine owners it is ignored. At the same time it is this last class whose necessity is the most pressing. At the beginning of all industrial art engaged in for profit is the usefulness of the knowledge of the costs of its production. Mining for the precious metals has been slower than other arts to recognize the value that can be gained by this knowledge. Costs have been kept, but as aggregates rather than in detail. In this, it is the value of detail in cost keeping that is insisted on.

The manager of every mine should keep in debit and credit form an account with every separable part of the work under his charge. It is the custom to aggregate the underground work into two accounts, mining work, and development or dead work. Each of these should be divided so that every separate drift, level or stope should have its own separate account. Part of these openings are dead work, that is, not directly productive at all. They would be closed out monthly, or whenever accounts were balanced for a statement, to an inclusive dead work account. Some of the dead work openings are productive of ore. These would be credited with the commercial metal values they produced, and only the net balance would be transferred in the closing out to dead work account. Other openings, such as stopes, which are distinctively intended as value producing, would have, like the others, debits made against them for labor, explosives, candles, timbers, blacksmithing, tools, etc., and credits by the commercial ore values taken out.

The keeping of such balanced accounts against individual mine openings keeps the management in

Fig. 2.—Sarnia Tunnel Under Detroit River, Mich. (See page 108.)

constant touch with the weak points of the mine. They show where the mining does not pay. The theory of maintaining an average value to the ore output of a mine by mining ore that pays higher than the average from one opening, and ore that does not pay its cost charges from another, is not defensible as good business. Yet it can readily occur where the average profit margin is small, unless there is a system of accounts such as described to discover and eliminate the mining that does not pay its own costs.

While it is in the preceding that the principal value of accurate detailed accounts resides, the other values of the detailed accounts in eliminating cost wastes, and increasing the efficiency of labor,

are important. The cost of securing the accounts may seem large, yet the saving of even a small amount of unprofitable underground mine work will pay the cost of a very considerable amount of book-keeping.

The same system of detailing the cost charges of milling and ore reduction works will be of similar service in promoting economy of cost and increasing the profit of production. While some wastes are not losses, and some savings are not economies, when the operation of mines and reduction works are considered, the basis of the knowledge of what are, and what are not, is a knowledge of the commercial facts such as can only be obtained by the kind of detailed, conscientious cost keeping described.

Assay Returns.

Assay returns as made by the public assayers are not always satisfactory in form. The difficulty is that they do not state the facts directly that it was the purpose of the assay to determine. Indirectly the figures given do state the facts, but it is necessary to make calculations on them and introduce elements not stated to arrive at the meaning of the assay.

The difficulty seems to be in the two points of view from which the assay figures are considered. The metallurgist, figuring on his plant or his process, wants to know the full metal content of the ore and the full commercial values in order to have a standard with which to compare estimated or actual results. The prospector and the mine owner want to know what the ore will sell for in order to know what the mine is worth. The practice of the public assayers is not uniform. Some give certificates of return that are satisfactory from the metallurgist's point of view. Some give certificates of assay that might be termed compromises. They do not fully satisfy the requirements of either point of view.

The present form of returns is to some extent a survival from the early days of Western metal mining, when metal production was gold and silver bullion which the mints would buy, less refining charges, at coinage values. The present wide extension of the mining industry, including lead and copper and a large number of metals and minerals of lesser commercial importance, has brought in a source of complication affecting the commercial meaning of assay returns without having induced a compensating change in the form of their statements. The result is more or less misunderstanding of facts and figures and dissatisfaction with assayers.

There seems to be no reason why assayers should not have a common standard form of certificate of assay which should fully meet the requirements both technically and commercially—a form that should give the metallurgist the figures he wants and at the same time give the additional figures and information that the prospector and mine owner want. To begin with, existing commercial conditions must be recognized. This is not a condition of each mine having its own mill and producing bullion. Custom smelters and their system of charges and rebates, and transportation, are new elements that affect commercial values. The waste substances in ores also affect commercial values. Assaying, while technically simpler than formerly, must be reckoned with as commercially more complex than formerly. Prospectors and mine owners should recognize this difference substantially. They should be prepared to pay for more service and better service than in the old days. The laborer is always worthy of his hire. The assayer of to-day gives more than formerly and

should be paid more. Cheap assaying means cheap, unreliable work, or, at any rate, incomplete work.

Precisely as what the prospector and mine owner want is more and better service, for which they must expect to pay; so must the public assayer give what is wanted. The standard form of certificate of assays should state these facts regarding the ore assayed: 1. The character of metallurgical treatment to which it is adapted and for which the assay values are determined. 2. The quantity in ounces per ton of gold and the commercial value. The certificate should state the full coinage value at \$20.67 an ounce, and the commercial value per ounce, \$18, \$19, \$20, or whatever is paid by the buyer made by the character of metallurgical treatment estimated on. 3. The quantity in ounces per ton of silver and the commercial value, in the same manner as for gold. Both the open market value of the metal as bullion should be stated and the value of the metal in the ore that would be paid for by the buyer. State it directly, instead of by percentages which involve calculation. 4. The quantity in percentage of lead and copper, and in pounds per ton of ore, and the market commercial value in the form of metal. Also, the certificate should state the quantity in pounds per ton of this gross amount that the character of metallurgical treatment will secure payment for to the miner, the price per pound that would be paid and the total sum. 5. The same data as under subdivision four for any other metal or valuable mineral. 6. The quantities in percentage of the several rock or metallic substances that are part of the matrix of the valuable metal ores for which the character of metallurgical treatment makes a payment, or requires one, together with the values. 7. Finally, the certificate should state, with the other figures in their order, the public treatment charges, if any, that would be made against the respective metal values, and there should be a separate summary of the highest net values that could be commercially realized from the ore.

Assay certificates, stating figures as called for by the suggested standard form, would be intelligible on their face. They would give the metallurgist what he needs to figure technically from, and they would tell the prospector and mine owner the commercial value of the ore directly. As it is now, the figures of an assay certificate are apt to be deceptive and misleading. They cannot be when completed in the form suggested.

There should be one general blank form which would be used for all assay returns, partial or complete. The style of the blank is something on which this journal would like to have the suggestions of the working assayers. A standard form for this purpose is important enough to justify time and care in the preparation. It should, when adopted, so satisfy present and possible future requirements that no change in it will be necessary.

By its adoption the range of work of assayers will be increased and so will be their responsibility. There should go with it an increase of compensation and a rise in the standard of professional qualifications.

THE foreign ownership of mines in the Pacific Maritime Province of Siberia has been prohibited by the Czar's ukase. The area affected by the order extends from Vladivostok to the Arctic ocean, including the island of Saghalien. The order shuts out foreign capital from the most desirable prospective mines in Siberia. It is the best portion of the placer gold-bearing area, and contains enormous deposits of iron and coal. It is an extension of the order issued some years since prohibiting the ownership of land in the city of Vladivostok by foreigners. The Chinese were particularly aimed at. By the exercise of superior thrift to that possessed by the Russians, they were buying back in peace the land the Russians had despoiled them of in war. The ukase was designed to stop this purchase of the lands by them. Now they lease the land for ninety-nine years instead, discounting an annual ground rental by paying the rent for the entire period in the first payment. In striking contrast with this action of the Russian Government, the Chamber of Commerce of the city of Tokio, Japan, has memorialized the Japanese Government to remove all restrictions on the foreign ownership of land and on foreign mining operations in Japan.

Lead in the Cœur d'Alenes.

The Cœur d'Alene Mining Journal, discussing optimistically the remarkably profitable lead-silver mining of last year and this year in the Cœur d'Alene district of Idaho, says: "It is a fact known to keen students of the lead industry that the trust is preparing to suspend mining in the lead-zinc districts it controls in Missouri and to force the low-grade lead mines of Colorado and Utah into a long, if not perpetual silence."

The optimistic views of a journal dealing with its own local industry are to be expected, but the quotation and more of the same tenor sounds very much like whistling to keep the courage up while going through a dark place with possible dangers lurking in it. The Cœur d'Alene lead-silver mines have been very profitable properties with lead at 4 cents a pound and silver at about 58 cents an ounce. The producing mines do yield about 50% of the total lead consumption of the United States, and the new mines under development may have prospects which will result in an additional production such that the district will yield an amount of lead equal to the entire consumption of the United States.

That ability of the Cœur d'Alene district to respond with any desired yield up to the entire consumption is the principal difficulty of the future price situation of lead. There are other districts that produce lead and other miners who have mines. First of all is the big smelting and refining combination which by controlling lead mines in Missouri in effect owns them and has itself become a miner of lead. If this company would shut down its own mines of lead, to buy lead from other mines that it does not own, it could only be because the profit from purchase was larger than the profit from mining. Judging from facts which the Cœur d'Alene Mining Journal admits, but glides over without making some very obvious deductions, the smelting company seems to be looking the other way. It has bought the Missouri lead mines this year. It did not have to load itself with them unless it proposed to use them. It has restricted the Cœur d'Alene production 25% to gain the time to unload its surplus stock of 40,000 tons of lead. It is to be presumed that it is unloading this surplus lead stock at 4 cents and that by the beginning of 1902 it will be clear of it. It has not renewed its contracts with the Cœur d'Alene mines. It has made new contracts with lead producers in Utah and Colorado which run into 1902 and beyond. The terms of these contracts and the character and metal content of the ores insure that they will be mined and delivered at lower prices for lead.

When this paper commented on the lead situation some months since, it quoted one of the principal men of the smelting company on the situation from its point of view. A remark made in the interview from which the quotation was taken, but not quoted then, was in effect that the smelting company had been holding the bag for the outside producers of lead, but would not continue to. As the situation has developed in the few months since then, it seems to an outside observer that they have got some one else to hold the bag. Unless there is a change between now and January 1st of 1902, the latter date will find the smelting company with no surplus stock of lead to lose on by lower prices, and with its own and contract supplies of lead ores sufficient to meet consumption and insure its profits no matter how the price of lead may tumble. The same date may find the Cœur d'Alene mines with no contract for the sale of its ores and no smelters or refineries to reduce them to commercial metal.

The strength of the Cœur d'Alene lead-silver mines is not in the lead production, the price of which is certain to take very large downward fluctuations, but in the silver, the price of which is much more stable. With sufficient silver content for the ores to pay the costs of mining and reduction for the silver, the lead production will be competitive and can find a market. But all the Cœur d'Alene mines do not carry enough silver in their ores to pay, and such may find it necessary to suspend, and the profits of the others will be seriously curtailed. Even if the Cœur d'Alene mines can supply all the lead consumption of the United States the commercial situation seems against their doing it.

Concentrates.

AN occasional coating with chalk will make a file cut cleaner and last longer.

CALIFORNIA in 1900 produced 500 pounds of the gem turquoise, valued at \$4 a pound.

THE coke used for smelting iron ores must have sufficient structure to hold up the iron ore in the furnace till the latter is reduced and the iron melted.

THE presence of molybdenite in a gold ore makes amalgamation impossible. Its foliated structures makes concentration of the ore difficult.

IT is said that there is a vein of natural coke in northern Sonora, Mexico, which some of the copper smelting companies are mining and using for smelting.

ONE reason for making large shafting hollow is the facility it provides for cooling the shaft in a heated bearing by running a stream of water through it.

THE total production of platinum in California from 1887 to 1900 inclusive, according to the records of the State Mining Bureau, was 3117 ounces, valued at \$15,301.

A COMPOUND pumping engine, using air instead of steam, has been patented. Between the cylinders the air is reheated by passing it through the suction of the pump.

WITH aerial wire rope tramways it is better to move a small load quickly and often than a heavy load slowly. The same amount of material is carried with a much lighter installation.

THE average amount of copper in Rossland, B. C., ores in 1900 was 9 pounds to the ton. In 1899 there was 33 pounds to the ton. The gold content was \$10.60 in 1899 and \$12.30 in 1900.

A CURRENT actuated water wheel has been invented with the buckets set on a sprocket chain instead of radially on a shaft. It is economical of material and has proven practical under use.

THE Waugh process is a method of dry or pneumatic concentration of ores. It is said to have been successfully used in the Black Hills, S. D., separating sulphurets preparatory to chlorination.

GERMAN designs for mine machinery are not as a rule useful models to imitate. They are as a rule needlessly complicated and costly and out of proportion to the service they are intended for.

A NEW record has been made in a rock drilling contest at Leadville, Colo., wherein Hupps & Lindquist of Ouray drove the drill 41½ inches, beating the Chamberlain and Andregg record by 1¾ inches.

THE total production of petroleum in Texas up to and including 1895 was 361 barrels. The production in 1900 was 836,039 barrels. The Beaumont field did not commence producing till this year.

MORE work can be obtained from coal by first burning it in a gas retort and then using the gas in an explosion engine than by burning it under a boiler, making steam and using the steam in an engine.

THE sulphurous fumes from copper roasting furnaces are very corrosive to metal roofing. An effective protection is asphaltum or a paraffine saturated felt coating. "P. & B." paint gives satisfaction.

FOR the royalty on gold mined in the Klondike Governor Ross of the Yukon Territory has recommended that an export duty on gold be substituted, payable at the frontier when the gold leaves the country.

A GOOD preparation for any steel or iron that as part of a structure is being imbedded in concrete or cement is to apply a sand blast to it, cleaning it thoroughly of rust and insuring a perfect contact of the cement with the metal.

IT is considered good engineering practice to push the work of a machine tool to the utmost limit. Get all that can be got out of it in work and get it out quick. This does not imply wasting the tool; it is intended to save the time of workmen.

THE Great Northern Railroad will substitute electric traction for locomotives on the Cascade mountain division, which includes the long tunnel which it has been found so difficult to ventilate and clear of the gases of coal combustion.

THE best stamp mill practice with free milling gold ores is to give the gold early and ample opportunity to amalgamate. Large surface inside plates should be used and the mercury fed to the battery sufficiently to keep the amalgam on the outside plates soft.

FERRO-CHROMIUM is made by reduction from chrome iron ore in the electric furnace. Only the purest natural mineral is used, and the product contains 70% chromium. It is used in hardening armor plate and armor-piercing projectiles. It is so hard that it will cut glass.

THE locator of a mining claim cannot close up roads, trails, ditches or easements of any nature that exist at the date of location. There can, however, be no easements except such as are public uses acquired in conformity with law, imposed on the land of the claim after location except by the consent of the claimant.

TO compensate for the wearing down of the dies in a stamp battery increasing the height of the screen discharge and decreasing pulp passing through it two devices are available. The screen frame can be changed, putting them in with successively lower inside chock

blocks, thus keeping about the same height of discharge, or the screens can be changed and successively coarser meshes used as the height of discharge increases. The first method is preferable.

THE failure of a miner to test, immediately on going into a working face after a blast, the rock overhead and high on a side for loosened masses, is considered cause for his peremptory discharge. The testing should be done before anything else and any rock that is loosened must be removed before starting to work in the face.

NEAR the north end of the island of Saghalien, which belongs to Russia and lies to the northward of the Japan Islands, there is a petroleum field of considerable extent and value. There is a lake of petroleum and a number of petroleum springs. A concession has been granted to a Russian to develop it, but nothing has been done with it yet.

BROMINE, in the modification of the cyanide process in which it is employed, is used as bromo-cyanogen—a white, crystalline, salt-like compound. It is added to the ordinary cyanide solution in proportion by weight never more than one to two, less even of the bromine salt being preferable. The process is patented in this country.

THE German schemes of ore concentration involve more hand sorting and grading than is practicable in this country with its very much higher labor costs. Hand picking here is limited to sorting out waste rock from the ore. At the most two grades of ore are made. In Germany as high as five grades of ore are made by the hand picking.

WITH cheap coal fuel, it is now considered by engineers that the copper line wire of an electrical transmission plant at the coal field is economically as efficient for the transportation of the energy of the coal for distances up to 200 miles as a railway coal train. The same consideration would apply with petroleum in place of coal as the fuel.

HIGH-GRADE drill steel should preferably not be heated in the forge over cherry red, so the manufacturers say. The difference between grades of drill steels is principally in the nature of the hardening process to which they have been subjected. The high-grade steels are what are known as air-hardened and hold the cutting edge better than carbon steels.

THE title to a mine owned by a mining corporation cannot be passed by the deed of a stockholder, even if he is the only stockholder and owns all the stock. The corporation must make the deed, and the stockholder must revive the corporation and provide it with a board of directors and officers, who must then proceed in strict conformity with the corporation statutes and the company by-laws.

BY using zinc fume or dust for precipitation in the cyanide process instead of zinc shavings, a closer and more uniform precipitation of the gold and silver is obtained, the gold slimes produced are richer, the cost for the zinc consumed is lower and the process is quicker. The U. S. Circuit Court has declared the De Lamar patent on the use of zinc dust invalid, so that it can be used without royalty payment.

WHERE the so-called "high bars" by a river have been rich in gold, it is safe to assume that the channel where the water flows is correspondingly poor. The pay lead at that particular point was in an old channel that has been left on one side of the present flowing stream. The river bed above and below the high bar is, however, likely to be fully as rich as the bar, and the gold from the up-stream end may have become distributed some distance down stream in the present river bed below the place of the old channel crossing.

IT is the practice in some mines to obtain filling for the open stoped ground by drifting into the wall rock and blasting it out. It is always desirable to figure the costs of this filling against filling brought from the surface. Breaking out of filling is much less costly on the surface than underground. To use it requires a chute from the stope to the surface or a compartment in the shaft made into a chute. With the latter kept full from the top it can be taken out at the bottom and moved in cars to the stope where required.

THE mineral chromite has been found satisfactory as a furnace lining for the smelting of copper ore. It is not fusible, nor is it attacked chemically by its own constituents or the constituents of the fusion of copper ore. Where it has been used successfully the walls were built of lumps of the native mineral, well compacted. No cementing material was used. The chromite came from Turkey and contained 52% of chromic acid. It has been suggested that 44% ore should be equally serviceable. This last is the grade of the California mineral.

LATE investigations tend to prove that copper in any amount below 1.3% does not injure the quality of steel. The detailed conclusions arrived at are as follows: 1. Between 0.5% and 1.3% copper has no deleterious effect on either the hot or cold property of steel. 2. A very large amount (2%) makes the steel more liable to be overheated. 3. In small quantities it slightly raises the tenacity and the elastic limit, but, unlike phosphorus, does not sensibly make the steel liable to fracture under sudden shock. Like carbon, it reduces the power of the steel to extend under stress, but this is not pronounced when the quantity is small. The effect is more marked when large quantities are present. 4. If the evidence of the tests of open-hearth steel made can be confirmed,

copper, instead of producing redshortness, has the contrary effect of changing redshort steel into steel which will roll without cracking.

THE variation of the needle stated on old mining maps of California mines should not be depended on where retracement of the lines is undertaken. Nor is a new determination of the variation certain to give a guide to the restoration. The facts are that many of the old surveyors made their surveys as if there was no hereafter. The variation was simply guessed at and assumed. About the best way to establish a variation with which to retrace the old lines is to assume that the old variation was a guess and apply to it as a correction the change in variation that the time interval elapsing since the survey has made.

THE proposition to mill and cyanide the Transvaal gold ores in plants established underground in the mines, while not impossible, cannot be accepted as certain to insure an economy of cost. At least 25% of the final tails would have to be hoisted to the surface owing to the gain in bulk of the mined and milled ore over ore in place. There would be extra costs of repumping and filtering the water used. As to saving in hoisting, three-fourths of the ore would be compelled to carry all the extra costs and still show a saving which seems a doubtful possibility. The flat cost of shaft hoisting of ore is now very small.

CONTINUOUS non-use of a water right for five years after it has been used would probably be held to operate to create a forfeiture, which would give a subsequent appropriator the priority of right to it. A ditch is a separate property from a particular water right and does not become forfeit for non-use. It may be abandoned; and, if abandoned, can be appropriated just as any other abandoned property. A claim can be made for a right of way in connection with another appropriation of a water right may be made which will actually appropriate an abandoned ditch. Unless, however, the ditch is abandoned, it cannot be appropriated legally even if it is on public land.

WHERE a mining district boundary or county boundary is not defined on the ground, the notice of location of a mining claim which subsequently appears to have been recorded at the wrong office is not invalidated thereby. The correction can be made by recording either the original copy with its endorsement of when and where recorded, or a certified copy of the erroneous record. It is preferable to make the corrected notice of record in this way rather than to make a record of a new copy. A relocation does not have to be made. There is no requirement in the nature of a time limit for making the correction. It is ordinary business prudence to make the record in the right office without delay, and at the same time to record the evidence of the earlier record.

THE nickel ores of Oregon closely resemble the New Caledonian ores. The deposit is in Douglas county, near the town of Riddles. Several square miles are covered from a few inches to 20 feet deep, averaging about 10 feet, with a layer of soft, porous serpentine full of cavities. Part of the cavities are filled with chrome iron, iron oxides and the nickel silicate. The deposit is a concentration following alteration through weathering, in a manner similar to the weathering of deposits of copper sulphides. The great mass of the deposit is low grade. The mining can be done very cheaply—with a steam shovel, in fact. With concentration a high-grade nickel ore should be separable, which could be made into a matte on smelting with such copper sulphide ores as are being worked in northern California.

THE Neill leaching process is a treatment based on the use of sulphurous acid for the recovery of copper from the oxide and carbonate ores. These minerals are reacted upon by sulphurous acid with the formation of cuprous sulphite (Cu_2SO_3). This salt is not soluble in water, but is soluble in water containing sulphurous acid—that is, the leaching solution must have an excess of the acid in it over that required to make the reaction. The copper is precipitated by driving off the excess of acid by heat. The precipitate is cupro-cuprous sulphite ($\text{CuSO}_3 \cdot \text{Cu}_2\text{SO}_3 + 2\text{H}_2\text{O}$) and contains 49.1% of copper. It is a heavy, crystalline compound, of dark-red color, which settles readily from the solution and can be washed by decantation, dried and reduced to metallic copper by fusion on the hearth of a reverberatory furnace. Very small amounts of other metals are dissolved and the product is very pure copper. In practice the ore is crushed to pass a 20-mesh, put in covered tanks and kept in a state of agitation while a current of sulphurous acid from the generators is forced through it. The copper will pass into solution in from one to four hours. The solution is drawn off through a filter press to separate the slimes. The latter and the sands are washed once with water, which is used over with the next charge. The solution in the precipitating tanks is heated with exhaust steam, precipitating the copper salt. The plant can be arranged to save nearly all the sulphurous acid except that combining with the copper. One pound of sulphur is required to convert four pounds of copper into sulphite, or, with the loss from the excess, one pound converts three pounds. The sulphurous gas can be obtained either by burning pyrite or sulphur. Roasting a copper sulphide ore to an oxide will provide ample acid for its own treatment. A test on a mixture of copper carbonates and some oxide in a siliceous ore gave 95% extraction. The recovery of the copper by fire alone affects a great saving over leaching, where iron is required to precipitate the copper.

Railroad Tunnels, Their Construction, Maintenance and Operation.*

This paper was prepared solely and purely from the construction point of view, with no regard whatever to operation.

The subject of the construction of tunnels is divisible into a great number of classes. From the point of view of construction, tunnels built for sewers, aqueducts or mines or for railroad service are identically the same.

A tunnel proper presupposes by its name that it is an underground passageway constructed from within, without breaking the surface of the ground. Those works, however, commonly called tunnels, which are constructed from the surface by methods of "cut and cover," are, properly speaking, "subways," but since in the public mind they are classed as the same thing, and as the resulting use of the completed work is identical, I propose to class such subways as are constructed for railroad service in cities as though they were tunnels, and give a brief explanation of their methods of construction also. This, you will see, is the more necessary since there is hardly any complete subway which has not had some portion of the work constructed as a tunnel, as the constructing engineer finds it best adapted to the local conditions and to economy in construction, and the two classes are so closely interwoven as to be inseparable in practical execution.

Speaking first of subway construction, the simplest condition is that in which the geological formations give solid rock, or some hard, self-supporting material in which to work—in which the surface has no buildings closely adjacent which would preclude free use of dynamite to break up the materials, and in which there are no street cars, or pipes, wires or other subsurface improvements to be considered or taken care of. In this case the work is usually laid out to full width for the external lines of the permanent linings, and either blasted and picked down or channelled by drilling the side lines and the entire center core blasted out, working it in benches, one in advance of the other, the number depending entirely on the depth to bottom grade. These ideally simple conditions are seldom found in practice, for if rock exists below the surface it usually has a heavy bed of loam or sand overlying, and in cities the interference by surface improvements is very serious and complicating; and it is the presence of these surface and subsurface improvements in cities which makes subway construction in rock formation so enormously expensive.

Under these conditions, it is easier and cheaper if the formation is found to be in clay, dry sand or other softer material than rock, which can be picked and shovelled, as there is then no danger of injury to the pipes, which require only ample support for maintenance in perfect safety. Under these conditions, the usual method necessary to adopt is to take out side trenches one on either side of the construction in which to construct the side walls. These trenches are supported with sheet piling or timber in every way similar to the methods used in our cities in sewer construction.

In the construction of a portion of the Reading Subway, in the city of Philadelphia, the loose soil was supported and maintained by driving piling on either side of the trench, the trench being made wide enough for the extreme bottom width of the wall construction. The sheet piling was cross-braced and supported by string timbers and cross-ties or spreaders, and the material excavated usually by pick and shovel to the depth of the bottom of foundations.

In this method of construction there are used sundry machines, such as the Carson trench machine, or the Lidgerwood Company's machine, for handling the material rapidly and economically and saving labor; but the essential principle common to them all is the excavating of the material, while at same time maintaining support to prevent caving of the sides. This is a perfectly simple piece of work, involving no difficulties of any moment, and certainly not more so than the difficulties found in excavating any foundation for buildings in the same neighborhood.

With the side walls constructed, it is a perfectly simple matter, involving merely labor, to excavate the central block or core between, as was done in building the subway under the Andrássy Strasse in the city of Buda Pesth.

On the Reading Subway, in the city of Philadelphia, recently constructed, the side walls were completed and the roof formed of the segmental arch.

The construction of subway in this manner, by excavating side trenches first and later taking out the core, reduces considerably the liability to accident and damage over the plan of taking out the full width at once, in cases where that width is of considerable dimension. If the width of subway to be constructed is great, as it is in cases where double-track railroad and standard-gauge cars are to be used, then the cross-timbering requires to be very heavy, as the handling of this involves a great deal

additional labor, which is materially reduced in the narrow trenches, made of timber.

In the construction of those portions of the subways in the city of Boston, which were built from the surface, it was usual to carry the street traffic on a false floor made of timber.

In this work in Boston a considerable amount of the construction was done as tunnel built from within, without breaking the surface of the street.

Of course, this method of subway construction becomes more difficult if quicksands or running sands are met, and is always considerably more expensive where large volumes of water require to be dealt with. In those cases the construction in this form is liable to become very much more expensive than the construction in tunnel, as the methods peculiarly adapted to tunnel construction in cases where water or running sand are encountered are not feasible in construction of an open cut.

The question as to whether a tunnel should be built by methods of cut and cover, or from within as tunnel, depends partly on local considerations of soil, but principally on the relative quantities of material to be moved and the relative cost of removal of the classified excavation. This is commonly equal at a depth of about 40 feet from the surface to bottom grade, although in the construction of the Blackwall tunnel in London it was found advantageous to build the approach on the Kent side of the river in open cut and cover down to a depth of about 70 feet below surface.

The essential condition in tunneling is the support of the face, sides and roof at all times and under all conditions. It is comparatively easy in the exercise of care and forethought to prevent any commencement of caving, even in the very worst materials in

rying out the work. Under these conditions, air pressure is almost entirely used in conjunction with percussion drills, and, if the rock is unusually hard, it is nowadays essential to install this method, even if the tunnel is short, as hand drilling in hard rock is slow and expensive.

The taking out of the heading in all these rock tunnels is the expensive part of the work. The removal of the bench is the cheaper work which brings down the cost of the tunnel as a whole. It is, therefore, obvious that the construction of a small-sized tunnel in rock is, yard for yard, more expensive than the construction of a double-track railroad tunnel; but there is a point in matter of size below which it is not in any way advantageous to go. The width of a tunnel must be sufficient to get an angle of cut such as to allow of blasting out the rock, and if the width is decreased in a rock heading below this point there is no economy to be gained.

There are large numbers of rock tunnels, however, which are constructed in seamy rock, or in shales which disintegrate, or in which "falls" occur which at times endanger the work and make construction difficult. In these cases it is essential to timber every bit of the tunnel as it is taken out for the support.

The explosives used in rock tunnel work are an important factor. Dynamite long ago displaced black powder. Now the gelatines are pushing dynamite hard.

Tunneling in soft ground introduces more complications.

The principle then involved is to drive a heading in advance of final tunnel construction which is so small that the ground will not cave in until the workmen can put in timber or plates to support it. Once hav-

Fig. 3.—Sarnia Tunnel Under Detroit River, Mich.

which tunnels can be constructed; but if ever any bad ground once gets a start at moving or caving, then hardly any power on earth can stop it.

In railroad construction the greater proportion of tunnels are built in rock formations of one sort or another. Outside of tunnel construction under rivers and waterways, or under streets of cities, these are constructed usually for one of two causes—either to cross from one watershed to another through an intervening line of hills, or to cut off curves on a line of road to shorten distance and improve alignment. The ideal condition is one in which the rock formation is absolutely self-supporting. The heading is usually driven from 50 to 100 feet in advance of the removal of the bench to full cross-section. The size of this heading depends upon the size of the completed tunnel. If it is a tunnel for a single-track railroad, the heading is usually the full width of the tunnel, while the height will be 8 or 9 feet, and the removal of the single bench in the rear will take out the entire tunnel to the full section required.

The construction of the tunnel is carried on by drilling either by hand or machine drills, and these holes are driven like a letter M. The lines of holes forming the center V are known as the "cut," while the straight legs on the sides are known as the "side round."

In cases where a tunnel is short in length and the expense of installing a power plant would not be warranted by the length of tunnel to be constructed, then it is usual to use hand power for drilling; but in all cases where the tunnel is of considerable length and the distribution of expense due to the cost of plant over the entire tunnel forms a reasonably small item, then this installation is of the greatest economy to the contractor, and the greatest efficiency in car-

ing the heading driven, the same principle applies for the enlargement. For as each small portion of the completed section is taken out, timbering or plates are put in place to support the ground from caving, until the entire section has the excavation removed, leaving an opening consisting of a mass of timber supports, vertical, horizontal and in every direction, with poling boards or plates of light sheet iron supporting the external surface, inside of which the permanent lining can be constructed, after which the supporting timbers, or struts, can safely be removed.

An arrangement used in the Hudson River tunnel is to drive a small heading consisting of a pipe of light sheet steel called a "Pilot tube," connecting its plates internally together by bolts, piece by piece. From the outside circumference of this pilot tube are struttled the poling boards or plates for the external full section, which necessitates the use of much shorter struts than the long ones which are necessary with the use of a mud sill.

In the construction of the portion of the subway recently completed in Paris, a good deal of the work was excavated by driving narrow headings or tunnels on each side of the street, in which were constructed the side walls of the completed tunnel. The same plan was adopted in portions of the Boston subway, and in both of these cases there was used an arching shield to support the superincumbent ground while the roof of the tunnel was being constructed.

The most difficult branch of tunnel construction is obviously that in ground which is so treacherous that it is unsafe to use any of the foregoing methods of construction. In such materials as quicksand, or water-bearing soil, or in decomposed schists, or under other conditions, there is no safe, feasible way of

* Abstract of a paper by J. V. Davies, read before the New York Railroad Club. See illustrations on front page.

construction but by use of pneumatic pressure in conjunction with hydraulic shield; and there is no method as rapid in progress or as safe in execution as this.

The use of air pressure permits of the support of the ground and the checking of the flow of water by equalizing the pressure within with the superincumbent weight of the ground. In order to use pneumatic pressure, the installation of an air lock is necessary. The air lock consists simply of a cylindrical tank or boiler with valves or doors at each end, opening in the same direction—that is, inwards against the pressure. The illustration (Fig. 1) of the air lock installed in the Blackwall tunnel under the Thames, in London, indicates two air locks on the working deck, which are used for the support of materials and for the ordinary use of the employees.

In addition to this, there is placed near the roof of the tunnel a third lock, which is known as the "emergency lock," and is for the use of men in cases of possible flooding of the tunnel when the lower lock might become submerged. The driving of tunnel is by use of hydraulic shield, and the two illustrations now to be given are of the front (Fig. 2) and rear (Fig. 3) portions of the shield which was used in driving the Sarnia tunnel under the Detroit river, between Canada and the United States.

The principle involved in the use of a shield is the support of every portion of the face, the roof and the sides of the tunnel, until permanent lining is completed and in place. As will be noticed, the shield consists of a bulkhead divided into sections, or compartments fitted with doors. In front of these compartments the men employed excavate as much of the section as they can possibly take out, and this amount depends upon the solidity and condition of the ground.

As each portion of ground in advance of the shield is removed, the hydraulic jacks in the rear are forced out, pushing the shield forward to take up any advance which is gained in excavation.

As the shield is advanced the length of a ring of plates—that is, from 16 to 24 inches in length—a new ring is erected in the rear of the shield bolted up and the shield is then again ready to push itself forward, using the pressure of the rams against the already completed length of lining, and advancing another section to permit of the putting in of yet another ring of plates.

A completed section of this type of tunnel is illustrated (Fig. 4) representing the East River gas tunnel, which clearly shows the rings of segmental plates bolted up and completed, forming a cylindrical tube of cast iron which is impervious to water and of great strength as well as durability.

In the construction of tunnel by shield method the erection of the shield is the first necessity, and there are three conditions under which this is usually carried out. In the Blackwall tunnel driving was commenced from an immense vertical shaft 58 feet diameter, sunk near the river front. In this case a circular hole is left in the lining of the shaft and from which construction proceeds.

The second method, which was used in the Sarnia tunnel, where a great open-cut approach was dug from the surface and the shield rolled down into place to commence tunnel construction.

The third condition was that adopted in the East River tunnel, where the erection had to be done by making an enlargement in the tunnel itself, which was supported during erection of the shield, and the shield built up in place piece by piece underground and under air pressure and driving started from that point. This is the most awkward condition and involves the greatest difficulty, owing to the cramped space in which men can work.

Tunnels are lined with various materials. If it is built in rock formation and cut stone is obtainable, then very common stone masonry is used for the side walls, and cut stone or brick for the arching. If good brick is obtainable, then the arching can be more substantially put in of brick in cement, where the side walls can be built of stone; but where good Portland cement and good hard rock is to be had, there is nothing more satisfactory than concrete lining throughout for both side walls and arches. The greatest secret in good, substantial lining of tunnels is the thorough and efficient packing of all space and crevices in the rear of the lining itself, and the bad packing in back of masonry is the cause of most of the trouble which the roadmaster has in the maintenance of his railroad tunnels.

In that respect the use of concrete for the entire lining is extremely advantageous, for in that case the centers or molds forming the internal surface of the lining are the only ones used, and the concrete is rammed to fill every space clear back to the construction timber or to the original ground itself, and the benefits resulting therefrom are very great. If the material through which tunnel was constructed is bad and liable to disintegrate, then it is essential—even with the use of masonry rock lining—to ram concrete in the rear of it, to fill all cavities and to prevent any commencement of caving of the ground, which is invariably the source of trouble originating in tunnel work.

At the time that we constructed the East River gas tunnel at Seventieth street, we had at one time in opening right through to the waters of the East river. We ran the pressure up to fifty-two pounds

per square inch, and worked under that pressure, while tomato cans and rubbish of all kinds came right into the tunnel from the river bed. The safety of tunneling by shield methods, and with the use of compressed air, was illustrated in the Blackwall tunnel in London, where the largest iron-lined tunnel ever built—25 feet internal diameter—was driven within 5 feet of the bed of the river with perfect safety. They had, of course, great difficulties to contend with; but the tunnel is built and is now in operation.

For the illustrations used we are indebted to the courtesy of Compressed Air.

Electric Copper Refining.*

When the electrolytic process was first attempted the cost of producing the refined copper by this method was as high as \$30 per ton, and even eight years ago the charge was \$20. This has come down now to \$8 to \$10 per ton. This is the direct result of improving the refineries and of economizing in the electric power. Some of the improved copper refineries in the Lake Superior region are the finest in the world, and they have brought the cost of refining the copper to the lowest cost. The question of saving in the fuel and operating expenses has been the most important in the development of this industry, and the solution has been one of gradual growth and experiment. In the last year the saving has been further reduced through the introduction of improved machinery and an increase in the motive power.

Both the multiple and the series processes are employed in electrolytic copper refining in the lake copper region, as well as in other parts of the country, and the relative importance of the two systems depends, in a measure, upon circumstances and topographical surroundings. The multiple system is the most generally used, and it is of greater relative value. The difference between the two systems is chiefly in the mode of arranging the electrodes. In the multiple system only one-half the anode copper is used as in the series system.

When the copper comes from the mines to the refinery it is in crude bars or cakes, such as produced by ordinary smelting and concentration processes. They are tested first as to the quality and value of the copper in them, and also as to amount of gold and silver mixed with the crude ore. They are then heated in a reverberatory furnace and prepared for the electrolytic bath in the form of anodes $2\frac{1}{2}$ feet in length and 2 feet 3 inches across. The anodes are carried from the furnace to depositing tanks to alternate with the cathodes of pure copper sheets. In each tank of the ordinary refinery there are about twenty to twenty-five anodes and twenty-five cathodes, separated from each other by about 14 inch.

In this multiple system the tanks are arranged in terraces, with each row separated by about 2 inches. A free circulation is kept up between the tanks, and an overflow pipe keeps the tanks properly filled, new fluid entering as fast as that drawn off. Electric traveling cranes usually supply the tanks with their material and carry the copper bars to the bath from the furnace. In the Anaconda refinery the electric traveling crane handles the copper from the time it enters the refinery until it is finished. In this refinery there are some 500 tanks arranged in rows or terraces, usually in pairs of double tanks.

The electrolyte prepared for the bath contains in solution 16% of bluestone and 5% of free sulphuric acid. The current enters the first tank through its anodes in multiple and proceeds through the bath to the adjacent cathodes, and from these it passes by copper connectors to the anodes of the second tank or bath. The copper connectors between the tanks are plates about 6 inches long, and they are carefully insulated from the negative conductor of the next bath. They connect the end of one anode in one tank with the cathode in the other.

The average electric current required for a refinery of thirty to fifty tons per day is about ten amperes to the square foot, counting both sides of the anode plate, and the flow of this current varies considerably, according to the quality of the anode. The amount of precious metals, arsenic and other impurities in the copper anode decides to a great extent the flow of the electric current. About twenty-four days and nights are necessary to transfer electrolytically the copper anode of about 275 pounds to the cathode plate. There is danger in employing a high current, for if the copper should have considerable silver and arsenic mixed with it the purity of the copper would be greatly lessened. The high current would carry part of the silver and arsenic to the copper to reduce its purity. Some copper is so pure and free from all impurities that as high as fifteen and twenty amperes can be used without danger. Several of the tanks are always out of circuit, and are in the process of being cleaned.

After the copper has been refined it is further prepared for commercial purposes in other parts of the refinery. Some is melted in the reverberatory furnaces again and cast in bar molds. These are of suitable size for drawing into wire and rods for commercial purposes. The deposited sheets of pure copper are also sold just as they come from the bath under the name of commercial cathodes. Sometimes the rich

copper is full of precious metals, carrying often as high as 500 and 600 ounces of gold or silver to the ton. All these metals and impurities are separated from the copper by the electrolytic process and deposited at the bottom of the tanks. They fall there in the form of a black mud. This mud or slime is carefully gathered up and screened. It is then boiled or stirred up in a lead-lined vat with hot dilute sulphuric acid. Hot air and steam are provided through a lead coil by means of an injector to help oxidize and dissolve the impurities of the mud. In this way the gold and silver are gradually concentrated in about eight to nine hours. There are usually, besides the gold and silver, such impurities as arsenic, antimony, bismuth, lead and tellurium.

There have been many improvements and changes in the last year or two in the copper refining methods. One of the most annoying features of the electrolysis is the action of the impurities on the cathodes. The arsenic, antimony and silver tend to collect on the cathodes, and, in time, make them unfit for use. In copper regions where the ore runs high in silver this difficulty is peculiarly hard to overcome, and it causes a considerable additional expense through the employment of laborers to wash the anodes. There have been a number of methods to overcome this trouble. The one commonly resorted to is to purify the electrolyte by filtration through a bed of copper oxide, and another by boiling with metastannic acid. Another method of purifying the electrolyte has been to cause oxidation with jets of air, but this process has not yet attained any great success. At the Anaconda refinery a process of purification is to pass the impure electrolyte repeatedly through a filter of oxidized granulated copper, and then later introduce jets of air.

In the series system of electric copper refining in this country special cathodes are not used, but one side of the anode plate serves as cathode. In this process the fluid itself serves as the conductor of the current and no copper connections between the anodes are necessary. The copper plates are arranged in series, and the tanks are much larger than those used in the multiple system. The fact that a good deal of scrap copper is produced by this process of refining makes it unpopular, and only a few refineries are in existence in this country. This drawback is a serious one, and not easily remedied. The multiple process requires only one-half the anode copper used in the series system with the same cathode surface. The cost of maintaining a plant to the highest efficiency has been found to be greater in the series process than in the multiple, but the former saves somewhat in the less loss of energy. The location of the refinery is consequently a factor of some importance, for if fuel is cheap or the power is supplied by waterfall the series system has little to show in its favor in the cost of the electric current. The cost of erecting a refinery is nearly the same in each system, with a slight advantage in favor of the series process.

It is estimated, on the whole, by modern refiners that there is a saving of nearly \$2 per ton of refined copper in the multiple system, and this difference in some localities and under favorable conditions can be even further extended. In some mining regions where the refinery is a part of a converting establishment, and run in conjunction with it, the saving has been as much as \$3 50 per ton. This is partly due to the fact that the anodes can be made directly from the converters. The average current efficiency of the multiple process is 95% as against 90% for the series process under similar conditions. Where the electric power is expensive, or fuel high-priced, the difference in the current efficiency of the two processes must always decide in favor of the multiple process of refining copper.

Extension of the Snoqualmie Falls, Wash., Power Co.'s Installation.

Two years have elapsed since the first current from Snoqualmie Falls was carried into the cities of Seattle and Tacoma, Wash., and already the initial installation has proven too small and the capacity of the plant is to be enlarged to meet the increasing demand for power. At the falls are installed four generating units, each consisting of a water wheel direct connected to a 2000 electrical H. P. Westinghouse three-phase alternator. At the same transmission voltage now employed—30,000 volts—it is proposed to develop and transmit 12,000 H. P. more, making a total output of 20,000 electrical H. P. The electrical machinery is to be wholly furnished by the Westinghouse Electric & Manufacturing Co.

The Abner Doble Co. of San Francisco, which furnished the water wheel equipment for the initial installation, are figuring upon placing their wheels in the new extension. If an impact wheel is used there will be a single wheel on each end of each generator shaft, and each wheel will be driven by a single jet of water 14 inches in diameter, the two jets combined being sufficient under the existing head of 270 feet to give the requisite power. The two water wheels and the generator between will be built on a single hollow shaft of oil-tempered nickel steel.

The present underground generating station, which is 200 feet long, is to be lengthened out 150 feet up stream to make room for the new installation. A

*GEORGE E. WALSH in Electrical Review.

new penstock is to be built which will carry 50% more water than the old one. The new transmission line will require 125 tons of aluminum wire. At Tacoma a brick and stone sub-station is now being erected. The entire cost of these improvements will be in the neighborhood of \$400,000. It is expected that the first of the new generators will be delivering current into Seattle and Tacoma within the next nine months. The generating machinery will consist of three 3000 K. W. (4000 H. P.) rotating field generators of the two-bearing type, generating a three-phase current at 1100 volts and 7200 alternations. The speed is to be 100 revolutions per minute. Each generator will require an exciting current of 320 amperes, approximately, at 125 volts. For exciting these three generators a 200 K. W., eight-pole, direct-current generator of the two-bearing type is to be used. At 175 revolutions per minute it is to deliver under normal load a current of 1600 amperes at 125 volts.

The current which is generated at 1100 volts is to be raised to a line potential of 30,000 volts by nine 1000 K. W., oil-insulated, water-cooled transformers. These are to be delta-connected on both the primary and secondary sides. It is estimated that each transformer will weigh 11,000 pounds and require 500 gallons of oil. The switchboard that is to be installed is to consist of fourteen panels of white marble, and is to be of the special type that was furnished for the original installation.

Vein Structure.

TO THE EDITOR:—Your issue of August 17th contains an interesting extract from the testimony of J. Ross Browne in the recent Grass Valley lawsuit. I trust you will also print the views of Mr. Janin on the same subject. The diagrams of vein structure given by Mr. Browne are ingenious and in part represent types accepted by mining geologists generally. The last one is, however, so much like the "lenticular" type often mentioned in technical literature that I feel impelled to call attention to its peculiarities, especially since the discussion can have no bearing on the lawsuit.

Throughout the southern United States the "gold belt" veins occur as lenticular bodies of quartz in schistose rocks. These lenses lie across the folia, approximately at right angles to the plane of schistosity. In the copper veins of the Piedmont region and those of Ducktown, Tenn., flat cross fractures are observed running at approximately right angles to the walls. In many ore deposits of the Rocky Mountain region the veins are similarly fractured; it is seen here at Butte. These fractures bear the same relation to the vein walls that the quartz lenses of the Appalachian deposits do to vein walls, which there coincide with foliation planes. This structure is illustrated in Fig. 1. It is figured by T. A.

FIG. 1.

FIG. 2.

FIG. 3.

Rickard in his account of several Australasian ore deposits. In many cases it is evident that this fissuring, whether quartz filled or not, is simply a result of rock strains accompanying movement of the fissure walls. Thus Fig. 2 shows that a force applied as indicated will not only produce vertical movement along the main fissure but also transverse, and where veins are crossed by flat fractures it is evident that post-mineral movements have taken place. These movements have often permitted circulating waters to produce secondary enrichment of the veins. It is the same in effect as the well-known double fracturing and apparent faulting of synchronous fractures formed by the vertical pressure in crushing tests of building stones, Fig. 3. The Pennsylvania vein structure, as interpreted by Mr. Browne, seems to me to accord more nearly with this theory and to be due to sheeting fissures which sheared the rocks, the horizontal component of the force-producing strain cracks between the fissures. In other words, the rending force, instead of producing a clean-cut single fissure, was distributed in several parallel non-persistent vertical fissures, the strained rock between being fractured.

WALTER HARVEY WEED.

Butte, Mont., Aug. 24, 1901.

For an engineer, in addition to the ability to form correct judgments, must be added the capacity to make a skillful and correct presentation of them in well chosen and fitting English. This ability cannot be taught by training in the writing of compositions, themes, reports, etc., alone; it must in great part be absorbed by an early and habitual reading of the best that has been written in all lines of thought.

A Plea for Greater Simplicity in the Language of Science.*

By T. A. RICKARD.

Scientific ideas are with difficulty soluble in human speech. Man, in his contemplation of the flux of phenomena at work all about him, is embarrassed by the want of a vehicle of thought adequate for expression, as a child whose stammering accents do not permit him to tell his mother the new ideas which suddenly crowd upon him when he meets with something alien to his experience.

Our knowledge of the mechanism of nature has been undergoing a process of growth, much of which has been sudden. It is not surprising, therefore, that the incompletely formed ideas of science should become translated into clumsy language, and that inexact thinking should be evidenced by vagueness of expression. This inexactness is often veiled by the liberal use of sonorous Greek-Latin words.

The growth of knowledge has required an increase in the medium of intellectual exchange. New conceptions have called for new terms. Sir Courtney Boyle has pointed out that the purity of a nation's coinage is properly safeguarded, while the verbal coinage of its national language is subject to no control. Specially qualified persons prepare the standards of gold and silver. This ensures the absolute purity of the measures of commercial exchange and gives the English sovereign and the American gold piece, for example, an assured circulation along all the avenues of commerce. It is not so with the standards of speech. The nation debases its language with slang, with hybrid and foreign words, the impure alloys and the cheap imports of its verbal coinage, mere tokens which should not be legal tender on the intellectual exchanges. France has an academy which in these matters has much of the authority given to the mint, whose essayers test our metal coins, but in our country the mintage of words is wholly unrestricted, and, as a consequence, the English language, circulating, as it does, to all the four corners of the globe, has received an admixture of fragments of speech taken from various languages, just as the currency with which one is paid at the frontier, where empires meet, includes the coinage of several governments, each of which passes with an equally liberal carelessness.

Science ignores geographical lines and bemoans the Babel of tongues which hinder the free interchange of ideas between all the peoples of the earth. Nevertheless, the international character of technical literature is suggested by the fact that the three languages—French, German and English—are practically recognized as the standard mediums of intellectual exchange. One of these affords the most lucid solvent of thought, another is the speech of the most philosophical of European people, and the third goes with world-wide dominion, so that each has a claim to become the recognized language of science. The brotherhood of thinking men will have been fully recognized when all agree to employ the same tongue in their intercourse, but such a "far-off, divine event" is not within the probabilities of the present. Consequently there remains for us only to make the best of our own particular language and to safeguard its purity, so that when it goes abroad the people of other countries may at least be assured that they are not dealing with the debased currency of speech.

Barrie has remarked that in this age the man of science appears to be the only one who has anything to say—and the only one who does not know how to say it. It is far otherwise in politics, an occupation which numbers among its followers a great many persons who have the ability for speaking far beyond anything worth the saying that they have to say. Nor is it so in the arts, the high priests of which, according to Huxley, have "the power of expression so cultivated that their sensual caterwauling may be almost mistaken for the music of the spheres." In science there is a language as of coded cablegrams, by the use of which a limited amount of information is conveyed through the medium of six-syllabled words. Even when not thus overburdened with technical terms, it is too often the case that scientific conceptions are conveyed in a raw and unpalatable form—mere indigestible chunks of knowledge, as it were, which are apt to provoke mental dyspepsia. Why, I ask, should the standard English prose of the day be a chastened art and the writing of science, in a great scientific era, merely an unkempt dressing of splendid ideas? The luminous expositions of Huxley, the occasional irradiating imagery of Tyndall, the manly speech of Le Conte and of a very few others, all serve simply to emphasize the fact that the literature of scientific research as a whole is characterized by a flat and ungainly style, which renders it distasteful to all but those who have a great hunger for learning.

To criticism of this sort the professional scientist can reply that he addresses himself not to the public at large, but to those who are themselves engaged in similar research, and he may be prompted to add to this the further statement that he cannot pitch the tone of his teaching so as to reach the unsentimental intelligence of persons who lack a technical edu-

cation. Furthermore, he will claim that he cannot without the use of the terms to which objection is made. However, in condemning the needless employment of bombastic words of classical origin, in place of plain English, I do not wish to be understood as attacking all technical terms. They are a necessary evil. Some of them are instruments of precision invented to cover particular scientific ideas. Old words have associations which sometimes unfit them to express new conceptions, and, therefore, fresh words are coined. The complaint lodged against the pompous, ungainly wordiness of a large part of the scientific writing of the day is that it is an obstacle to the spread of knowledge.

Let us consider the subject as it is thus presented. In the first place, does the excessive use of technical terms impede the advancement of science? I think it does. It kills the grace and purity of the literature by means of which the discoveries of science are made known. Ruskin, himself a most accurate observer of nature and also a geologist, said that he was stopped from pursuing his studies "by the quite frightful inaccuracy of the scientific people's terms, which is the consequence of their always trying to write mixed Latin and English, so losing the grace of the one and the sense of the other." But grace of diction is not needed, it may well be said. That is true; and it is also true that a clear, forceful, unadorned mode of expression is more difficult of attainment, and more desirable in the teaching of science, than either grace or fluency of diction. One must not, as Huxley himself remarks, "varnish the fair face of Truth with that pestilent cosmetic, rhetoric;" and Huxley most assuredly solved the problem of how to avoid rhetorical cosmetics and yet convey deep reasoning on the most complex of subjects in addresses which are not only clear as a trout stream, but are also brightened by warm touches of humanity, keen wit and the glow of his own courageous manhood. Nevertheless, though clearness of expression be the first desired, yet grace is not to be scorned. When you have a teaching to convey it is well to employ all the aids which will enable you to get a sympathetic hearing. Man lives not by bread alone, much less by stones. He likes his mental food garnished with a sauce. Let the cooking be good, of course, but a chef knows the value of a well-seasoned adjunct to the best dish.

Our language is capable of a grace and a finish greater than we give it credit. That it is possible to write on geology, for instance, in the most exquisite, simple English has been amply proved by Ruskin, whose "Deucalion" and "Modern Painters" contain many pages, describing accurately the structure of rocks and mountains, and dealing with their geological features in language which is marked by the most sparing use of words which have not an Anglo-Saxon origin.

The next aspect of the enquiry is whether the language of science, apart from the view of mere grace of style in literature, is not likely, in its present every-day form, to delay the advance of knowledge by its very obscurity. Leaving the reader's feelings out of the argument, for the present, it seems obvious that the whole purpose of science—namely, the search after truth, which is best advanced by accuracy of observation and exactness of statement—is hindered by a phraseology which sometimes means very much but oftener means very little, and, on the whole, is most serviceable when required as a cloak for ignorance. To distinguish between what we know and what we think we know—to comprehend accurately the little that we do know—surely these are the foundations of scientific progress. If a man knows what a thing really is, he can say so, describing it, for example, as being black or white; if he does not know, he masks his ignorance by stating in a few Greek or Latin terms that it partakes of the general quality of grayness. Writers get into the habit of using words that they do not clearly understand themselves, and which, as a consequence, must fail in conveying an exact meaning to their readers. Many persons who possess only the smattering of a subject are apt to splash all over it with words of learned sound, which are more quickly acquired, of course, than the reality of knowledge. Huxley said that if a man does really know his subject "he will be able to speak of it in an easy language with the completeness of conviction with which he talks of an ordinary every-day matter. If he does not, he will be afraid to wander beyond the limits of the technical phraseology which he has got up." If an scientific writer should complain that simplicity of speech is impracticable in dealing with essentially technical subjects, I refer him to the course of lectures delivered by Huxley to working men, lectures which conveyed original investigations of the greatest importance, in language which was as easily understood by his audience as it was accurate when regarded from a purely professional standpoint.

(TO BE CONTINUED.)

TO SUCH AN EXTENT has labor been eliminated from the manufacture of iron in the United States that every man employed about the iron mines in every capacity delivers four tons of iron per day, and in the production of the large steel works to-day represents only about one man power, including the clerical force, to between two and three tons of steel.

* Read before the American Association for the Advancement of Science, Denver meeting, Aug. 27, 1901.

Mining and Metallurgical Patents.

Patents Issued September 2, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

VALVELESS ROCK DRILL.—No. 681,428; R. L. Ambrose, Tarrytown, N. Y.

A cylinder having separate admission and exhaust ports for each end of cylinder, and a common inlet port, of a piston, having a reduced central portion and adapted to control ports, ports being so located with respect to each other and to piston that during a rearward stroke of piston exhaust closure at rear end is substantially simultaneous with admission cut-off at forward end, but is prior to exhaust release thereat.

AERIAL WIRE-ROPE TRAMWAY.—No. 682,149; J. H. Montgomery, Denver, Colo.

An endless cable and buckets, a line of single poles, brackets mounted on poles and projecting on opposite sides, two pairs of pulleys mounted on each bracket, and a pair of co-operating pulleys engaging cable on each side of pole, individual pulleys of each pair, engaging cable at same point and being located respectively above and below cable.

ELECTROLYTIC APPARATUS FOR EXTRACTING PRECIOUS METALS.—No. 682,155; C. P. Tatro and G. Dellus, Seattle, Wash.

A tub, a metallic pan in bottom, mercury in pan, a

lid for tub, a series of carbons attached to and depending from lid inside of tub and connected together to form an anode, an agitator vertically journaled in lid and having screw propeller-shaped blades located to revolve below carbons, one or more balance weights connected with lid, vertical guide-ways for lid, and electric connections between carbons and one side of a battery and between pan and mercury and other side of battery.

STAMP MILL.—No. 681,858; F. B. Pettengill, Los Angeles, Cal.

A stamp, a mortar with a die at bottom, a chute to feed ore onto die, a downwardly directed air-blast nozzle arranged below ore chute to direct an air blast across path of ore and to direct ore toward die, an opening being provided just above path of blast in mortar wall opposite air-blast nozzle, an outwardly and upwardly slanting screen in opening, and means for shaking screen.

CRUSHING OR PULVERIZING APPARATUS.—No. 682,087; W. Kitto, Hammersmith, Eng.

A vertical driving spindle, a bell-shaped ball propeller driven by spindle and provided on its outer surface with vertical, radiating wings, a ball raceway into bell-shaped propeller, open to atmosphere at its lower end and through which and propeller an air current is created by radiating wings, ascending air-escape trunks arranged outside propeller, and an air-supply pipe constructed to direct air onto ball raceway.

CONCENTRATOR.—No. 682,053; P. C. Forrester, Spring Valley, Ill.

A water tank, a vibrating sluice arranged in tank, block arranged in bottom of sluice and having varying height, projections diminishing toward outlet end of sluice, and an endless belt movable through sluice and upon blocks.

CHAIR FOR MINING CAGES.—No. 681,675; M. H. Beck and J. R. Caynor, Victor, Colo.

A cage, an upright chair on cage provided with a hook adapted to interlock with a suitable support of a mining shaft and means for operating the chair.

Owens Lake, Inyo County, Cal.

Written for the MINING AND SCIENTIFIC PRESS.

The Reno Development Co. have been engaged for sixteen years in exploiting Owens lake, in Inyo county, Cal. It is an alkaline body of water, containing as much common salt as average sea water. About 3% of its total weight is carbonates of soda, a little over 1½% is sulphate of soda and it is estimated it contains over 1,000,000 tons of borax. The borax, however, is in such a dilute solution that no means are known at present to utilize it. At the present time the only soluble mineral is the carbonate of soda, of which about 10,000 tons are produced annually by the Reno Co., and sold either in its natural state as produced—a compound of carbonate and bicarbonate of soda plus water of crystallization—or as soda ash, the natural product calcined.

In the natural form it is shipped to borax works at Alameda, Cal., and used to produce commercial borax from colemanite (borate of lime). The larger use of the natural soda is in the form of soda ash. The furnace used for calcining is in the form of an upright kiln, the fuel used being vaporized petroleum. The market for the soda ash produced has been so far with the glass works and washing soda factories of San Francisco. Lately a very promising market has been opened in Japan. This soda ash is considered equal to the finest English soda ash with which it competes for a market in Japan.

Owens lake has at the present time no outlet. Ancient shore lines indicate that the level of the lake was once 190 feet higher, at which time it had a southern outlet. The lake has an average depth of perhaps 40 feet and an area of 100 square miles. It is estimated to contain over 40,000,000 tons of the carbonate of soda. The carbonate of soda is recovered from the waters by pumping the water into clay vats and then evaporating by the sun's heat until the soda precipitates as crystals. These crystals require a certain amount of skill in the regulation of the crystallization to obtain in a state of purity, and such crystallization can only be carried on in the hot months of summer. The final result of the summer's work is a cake of soda from 2 to 4 inches in thickness over the surface of the crystallizing vats. These vats cover an area of an acre each, about 100 acres in all.

The works of the Reno Dev. Co. are at Keeler on the eastern shore of the lake and the terminus of the railroad. R. J. Laws of Carson is general superintendent and Herbert L. Wrinkle is resident superintendent at the lake.

In a lecture on mechanical rock drilling, delivered by M. Henri Ghysen, Ingenieur des Mines, Belgium, he described two important drivings, one by means of hydraulic rock drills and the other by electric drills, arriving at the following conclusions: The electric rock drill is far more suited to the work of collieries than is the hydraulic drill, on account of its slight weight and easy management. It is set up with less difficulty, and if the advance obtained is not quite so great, this circumstance is largely set off by the diminished cost of working. The hydraulic rock drill is, however, calculated to render good service in very hard rocks when great speed of execution is required, and under which circumstances the advance made with the electric drill becomes slight. On the whole, in the works required at collieries the electric must be regarded as more economical than the hydraulic drill.

It may be taken as an axiom that a perfect mine report cannot be made without a plan—that is, of course, unless it be something that can be condemned at a glance and summed up with a terse "No good." This plan or map must be something to show where samples are taken, where pay shoots begin and where they end, the reference of one level to another and the hundred and one details which will occur to the engineer.

The Government telegraph cable between Juneau and Skaguay, Alaska, has been successfully laid and now in operation. With the completion of the construction of a short gap in the land line between Glenora and Ashcroft, in British Columbia, Juneau will be in telegraphic communication with the rest of the world.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

W. J. Sutherland of London, president of the Alaska Perseverance M. Co., has obtained possession of the Jumbo mine in Silver Bow basin near Juneau. In 1889 a 10-stamp mill was erected on this property and continued in operation until 1895, when the mill was carried away by a snowslide. Work has been begun on the reopening of the mine under the supervision of C. H. Pierce, formerly of the Treadwell mine on Douglas island.

VALDEZ.

Revised estimates make the output of the Chesterhena district \$500,000, and possibly \$600,000. A stampede to the new diggings on Bremner river was started late in August. Prospectors who come in to Valdez for supplies refuse to give particulars. Some gold, but not pay, was found on this river in 1898. The new diggings are about 90 miles northeast of Valdez and have an open season of about eight months. Several parties returned to Valdez from an examination of the copper discoveries in the Chittyna and Tasnuna country confirm the report that immense ledges of copper, azurite and bornite, running from 20% to 50% copper, exist in those districts.

ARIZONA.

GRAHAM COUNTY.

H. E. Butterfield, interested with C. B. Stocking in a gold mine near Morenci, says they are running a tunnel to cut the ledge, which is over 2 feet wide on the surface and rich in free gold.

PIMA COUNTY.

Miners from Willcox say the placer diggings recently discovered 4 miles from Dos Cabezas mining camp are rich and more extensive than at first supposed. Some big nuggets have been taken out. The discovery was made by a Mexican shepherd, who kept it secret for some time. A large number of claims have been staked out and a half dozen Americans are taking out from \$5 to \$15 a day. They report that the ground becomes richer as they get to bedrock. Water is scarce in the canyon and they are compelled to pack gravel which bears gold to a distant stream.

A Denver syndicate has bonded a prospect owned by P. O'Day and P. Sullivan, near Tucson, in the Catalina mountains, at \$75,000, 10% being paid down. Work is to be commenced with thirty men.

PINAL COUNTY.

It is reported that the Zeckendorf interests have taken control of the Ray copper mines, limited, by paying to the English stockholders all they expended in railroad construction and improvements at Kelvin. It is also stated that the new owners will resume operations very soon.

YAVAPAI COUNTY.

The Howell M. Co. have ordered boiler, hoist and pump for the Iron King mine, Big Bug district. The hoist, of capacity to sink 600 feet, will be placed on shaft No. 2. There are 638 feet of crosscuts and drifts, all in ore. The company will put up substantial buildings.

The Rich Hill M. Co. has been incorporated at Phoenix, capital \$100,000, by H. A. McKee, C. W. McKee and F. Pendergast. The claims proposed to be worked by the company are called the W. Y. O. D. claims and are located in Rich Hill, near Octave.

CALIFORNIA.

AMADOR COUNTY.

The High Point M. Co. of Des Moines, Iowa, has brought suit for \$11,000 damages against C. E. Brown and wife of Plymouth, because of a violation of contract of sale of the Gowanus and Blue Belle mines at Plymouth.

CALAVERAS COUNTY.

The Calaveras M. Water & Power Co. has been incorporated. Capital, \$200,000; office, San Francisco; works, Calaveras county; directors, L. Pence, C. J. Pence, R. W. Ostrom, A. Schloss and D. Fricot.

INYO COUNTY.

G. F. Willis and J. C. Roeper have leased the old Green Monster mine, near Independence Station, for two years. The mine has been idle for many years. Should working tests prove satisfactory, the lessors expect to be able to ship a carload of ore daily.

J. C. McMillan has shipped a 60-ton lot of ore from the Eva Belle mine, near Plute Station, averaging probably \$50 a ton. The work done on it is through a 130-foot tunnel, at the end of which drifts have been run along a 5-foot ledge of ore averaging about \$20 per ton value. It carries

a small percentage of copper, and gold and silver in about equal values.

KERN COUNTY.

The Gold Coin and Stanford mines at Randsburg are milling ore at the Red Dog mill, which is expected to average \$50 per ton, or better. These mines are owned by Nixon, Kuffel and Mann of Randsburg, and up to the present they have hoisted with a whim, but increasing depth has made a change necessary and a gasoline hoist is under consideration.

MARIPOSA COUNTY.

At the Garibaldi mine at Bull Creek, near Mariposa, the main double-compartment shaft is down 365 feet.

MONO COUNTY.

The molybdenite mine recently discovered by Robert & Cameron is on the eastern tributary of the Walker river, near the summit. They are working the mine and intend putting up a plant to prepare the ore for shipment.

NEVADA COUNTY.

At the Seven-Thirty mine at Nevada City the shaft is down 200 feet and drifts are being run on a ledge from 8 inches to a foot in thickness. The Seven-Thirty is being developed by Reilly, Voss & Co.

A company represented by G. W. Root of Sacramento and J. W. Heiser has bonded the Green Mountain mine, near Nevada City, and operations will be commenced about October 10th. The shaft is down 600 feet and the new company will sink deeper.

The old Grizzly Hill hydraulic mine, near Blue Tent, has been leased by a Sonoma company, headed by G. P. Hall, J. P. Berry and C. H. Ohm, and will commence operations soon. It is proposed to quarry the gravel channel and to crush the ore in a Crow mill having a capacity of 250 tons a day.

At the annual meeting of the Home M. Co. at Grass Valley D. J. McFall was re-elected Supt. It is the intention of the company to put in more stamps soon. The old board of directors was re-elected, L. J. Rose being made president, R. J. Bonestell secretary.

PLACER COUNTY.

At the Santa Fe at Canada Hill, Westville P. O., gravel has been struck which prospects. W. Morgan, D. Kirby, E. Wooldridge, A. R. Green, W. N. Hazen and H. G. Ponting of Auburn own the mine.

PLUMAS COUNTY.

C. R. Thompson is pushing work at his mine on Rich gulch, below Quincy, and is moving a quartz mill to the property. It is reported that the mine has developed a 4-foot vein of high-grade ore.

SHASTA COUNTY.

The Sybil mine, near French Gulch, which produced fast enough to be bought by G. A. Von Kruze from the proceeds of the ore, is now producing rock that is too rich for the Keswick smelter to handle. It is claimed to go over \$200 a ton, that being the limit on rock worked at Keswick. Twenty tons have been taken out by two miners in a month. The ledge averages 8 inches in width. A depth of 400 feet has been reached. The owner will install a power drill.

Fifty carloads of copper bullion have already been shipped from the De Lamar smelter, at De Lamar, to the refinery at Elizabeth, N. J. Wood is being hauled in from Pitt river by 57 teams. An addition to the bullion room is being constructed to receive the output of the new converters. The brickqueting, or "brick," machine now runs at night as well as day, 10-hour shifts, with seven men on each shift.

L. M. Lane and C. F. Daugherty have granted an option to E. Holden and R. J. Jennings on their copper claim near Sims. The bond is in the sum of \$1500 and time one year. The bond proposes to develop the property.

J. W. Parmelee, owner of the Minnesota mine near Iron Mountain, states that he intends to reopen the mine. A hoist and pump, both operated by water power, will be put in. There is a 10-stamp quartz mill on the property, but as the ore is base it will be sold to the smelters at Keswick. The Iron Mountain railway passes but a short distance from the mine and affords easy transportation. Associated with Mr. Parmelee is A. Longstreet of Chicago.

The South Fork M. & Dev. Co., B. F. Rodgers, superintendent, have 24 miners employed. This Boston company is developing several gold properties, including the old Chicago mine, on South Fork of Clear creek, about four miles northwest of Igo. Mr. Rodgers is driving a 2900-foot tunnel with air compressor drills, and has the tunnel in 800 feet.

A new copper camp will probably be opened up in Shasta county on the north bank of Pitt river in what is known as the Kosk Creek country. Several properties in this district were exploited to some extent several years ago by Redding people,

and now extensive development work is to be done. W. Murray of Shasta is at the head of a company of Redding and Red Bluff people developing a property in the Kosk Creek district.

The Balaklala copper mine, near Copley, is reported bonded for \$650,000, with \$20,000 paid down.

L. B. Hines of Harrison Gulch has bonded the Cadiz, Ohio, Isabelle, Blue and Pacific mining claims, in the Harrison Gulch district, to W. J. Thurman at \$6000.

SIERRA COUNTY.

W. J. and G. A. Charters of Canton, Ohio, have located a ledge which bears copper ore. It is between Sierra City and Downville.

The Four Hills Co. is installing a 50-ton cyanide plant at the mine near Sierra City. A new assay office has been added. The work of sinking the shaft has been resumed. Forty-five men are now employed. Connected with the mine is a small sawmill with a capacity of 5000 feet per day. The power to operate the machinery of this mine is furnished by a 200 H. P. electric plant, run by water under 925 feet head from a chain of lakes near by.

W. Lawry of Downville, operating on Rock creek, has struck a rich body of gravel. The shaft is down 160 feet and 6 feet in gravel when a heavy flow of water stopped sinking. A pump is to be installed and the shaft continued to bedrock.

J. A. Reid, S. Kelley and L. C. Harden of the Four Hills mine, and T. T. Hughes of Downville, have leased the Four Hills drift mine from the Hughes estate for one year and will prospect for a back channel supposed to exist on the property.

SISKIYOU COUNTY.

The Pinch Creek mine near Yreka has been put in shape for working by D. McCook. This mine is owned by A. E. Raynes, R. H. DeWitt, J. F. Farraher and D. McCook of Yreka, who intend working it, milling the ore in the McCook mill.

The Sheba quartz mine at Patterson creek, in Scott valley, has been started up. This mine paid well when first opened, and encouraged the owners to erect a fine mill, with hoisting apparatus and other modern machinery.

The Oregon & California mine on Klamath river, 4 miles below Klamathon, has been bought by C. W. Tyrer of Siskiyou county, H. B. Kelly and G. B. Goodell of Portland, Or., for \$10,000. A 5-stamp mill is on the mine. The development work consists of 500 feet of tunneling and a 350-foot shaft. The new owners will operate the property on an extensive scale. They have bought the machinery on the old Eureka tellurium mine near Redding from the Eureka Tellurium M. Co. of San Francisco, and are having it removed to their mine near Klamathon.

TRINITY COUNTY.

G. L. Bailey of Weaverville says that at the Chloride mine at Dedrick the ledge has been tapped at a depth of 700 feet larger and richer than ever. The mill is running steadily on good ore and gold cleanups are regularly made.

At the Mason & Thayer mine at Dedrick a force of men are at work and the ledge is strong and rich.

Noble Bros. have struck promising quartz on their claim at New River, which is now bonded by people who have taken about a ton of the quartz to San Francisco to be milled. It is said that the ledge is about 8 feet wide.

The Sweetstake G. M. Co. has bought the Hupp & McMurray gravel mines at Weaverville, which have produced more than a million dollars. The mines consist of 1000 acres of gravel, which have been worked for forty-two years. Hupp Bros. have been placed in charge as Supts. The force has been increased to thirty men, working day and night. Flumes and ditches are being enlarged, an electric light plant is to be put in, and also a water power cable system.

TUOLUMNE COUNTY.

A \$1000 payment has been made on the Porto Fino to J. H. West of Soulsbyville. A steam hoist was recently placed upon this property and the old shaft cleaned out and retimbered.

At the Draper sinking continues, the shaft now being 480 feet in depth.

The owners of the Black Oak mine are having a ditch constructed from Arrastraville to the mine.

The air compressor at the Street mine, Tuttle town, is in successful operation. Grading for a 5 stamp mill to be operated by water power from Frietas ditch, is under way. The veins are narrow but high grade. At present the shaft is 300 feet deep.

M. Tate, J. R. Ryland and L. C. Traller of Santa Clara county, have sold the Rising Sun, Fairview, Last Chance and Pearl mining claims, situated above Arrastraville, to the Blue Slate M. & M. Co. for \$80,000.

The old shaft on the Wild Cat mine, at

Sonora, has been discovered by sinking 20 feet. The timbers were found to be in good condition. The property is under bond to E. DeHaven from P. B. Bacon.

The Keltz mine, at Sonora, has resumed operations under the superintendency of Mr. Knox, formerly of the Riverside mine. The property was recently bonded to San Francisco people.

COLORADO.

BOULDER COUNTY.

A strike has been made in the Silent Friend mine at Ward of a large body of first-class ore. The strike is in the 600-foot level of a 28-inch wide streak of ore of which 8 inches is smelting grade which will average \$50 per ton, and 2 feet is first-class mill ore. This mine is owned by the Welcome G. M. & M. Co., with G. L. Spence as general manager.

CLEAR CREEK COUNTY.

The Gold Anchor mine, under bond to T. Slater for \$14,000, has been bought by the Gold Anchor M. Co., composed of Indiana capitalists, and the bond paid off. T. Slater will be the manager. Machinery will be placed on the mine.

GILPIN COUNTY.

Colorado and Eastern men are trying to effect a consolidation of the Klondike, Linden Castle, Texas, Mahaska, Democrat, Coaley and Gilpin silver-bearing veins, situated on the mountain dividing Four Mile and Silver gulches, near Blackhawk, for development under one management.

Sinking is being done at the Carr mine. Manager S. Hoskin says about 4½ feet per day is being made. The shaft is now down 700 feet and will be continued to a depth of 2000 feet. The work is principally development. The terminals of the aerial tramway have been completed. This tramway is intended to convey the ore from the Carr mine to the Randolph mill at Black Hawk, and also to convey coal and water from the mill to the mine.

GUNNISON COUNTY.

The Grafflin M. Co. is operating the Iron Cap mine at Spencer and is said to be intending to immediately equip it with a plant of stamp milling machinery and necessary buildings.

HINDSdale COUNTY.

(Special Correspondence).—At the Hidden Treasure, located near Lake City, the mill is not being operated at present, but extensive development work is being done in the mine. At the upper terminal of the tram line the main shaft has been sunk about 1000 feet on the ledge and is to be sunk 200 feet deeper to the level of the Ute tunnel, to make a ventilation connection for the mine. Six levels have been run on the vein from the main shaft, each from 700 to 1000 feet, with considerable stoping. The main vein follows the alignment of the mountains from northeast to southwest. A new tunnel has been started near the mill which is calculated to cut the ore body at 3800 feet from the tunnel entrance and 1700 feet below the surface. The work has progressed 300 feet. The Hidden Treasure ores are sulphides. The sorted ores and concentrates run 62% to 65% lead, 15 ounces to 20 ounces silver, 1½% iron, a small per cent of zinc and small values in gold. In concentrating the mill makes jig and table products, most of the gold going out with the zinc slimes which are not saved. Supt. P. C. McCarthy states that the mine contains one block of ore 350 feet long, 140 feet high, with the vein 3 to 4 feet wide.

Lake City, Sept. 8.

LAKE COUNTY.

The old Harrison reduction works, owned by the St. Louis S. & R. Co., idle for a number of years, has been leased to be made into a smelting plant for the treatment of low-grade ores of the Leadville district. The New Jersey G. & C. R. Co. is the operating company, of which J. A. Jeannotte is president, C. A. Miller manager and E. V. Hoagland secretary. A great deal of machinery will have to be replaced by more modern types.

A strike is reported from the 500-foot level in the Cloud City mine at Leadville of carbonate ore carrying good values in silver and some gold. The property is owned by the Cloud City M. Co., W. F. Jones, manager.

The mines of Leadville district produced 70,000 tons of shipping ore in August. Of this the American S. & R. Co. bought 61,000 tons, the balance being consigned to the zinc smelters in Missouri, Kansas and Wisconsin. This large aggregate represents only the amount that the market can handle of the classes of mineral produced in the district. The restriction is accounted for by the limited facilities of the smelters for calcining or roasting sulphides. The amount they are using represents their utmost present capacity for the classes mentioned, but if the capacity of roasting furnaces and automatic machines could be increased

the production could be made equal to the increase of capacity.

OURAY COUNTY.

(Special Correspondence).—The Governor group, on Stoney mountain, is in charge of W. Billesbach. It contains two parallel veins, one carrying gold chiefly and the other silver. Development is through a tunnel that cuts the two veins. Besides this there is a considerable amount of drifting. The gold ore mined is a white quartz, carrying some tellurium, iron sulphides, with silver and gold. The silver-bearing vein carries lead and iron sulphides, with some seams of ruby silver. Shipments of the higher grades are being made. An air compressor of the Leyner type is being installed. There is a large tonnage of mill ore on the dump and much more of the same grade seems to be in sight. The erection of a concentrating mill is contemplated.

At the foot of Yankee Boy basin is the Trust-Ruby mine and mill, the latter not being operated at present. The property has two tunnels, the upper in 300 feet, the lower 1500 feet, both on the vein. The two are connected underground. A small force is at work, in charge of John Wahl. The ores are a copper, iron and lead sulphide.

Farther up toward the head of Yankee Boy basin, almost at the foot of Mt. Sneffels, is the Altoona group, which is being developed under the management of J. D. Spalding. Present work comprises three tunnels and shaft. The ores consist of an iron and lead sulphide, the chief values being in silver. The quartz gangue carries some fine specimens of ruby silver and gray copper. The hoist is operated by a gasoline engine. A second gasoline engine operates an electric generator, which furnishes power for two Durkee drills. Buildings are being erected so as to operate all through the winter.

Sneffels, Sept. 5.

SAGUACHE COUNTY.

C. R. Gehl, L. L. May and O. Taubert of St. Paul, Minn., have bought the Evening Star mine at Alder and are developing it. The vein is over 20 feet wide and shows good values in silver, lead and some gold. It has a tunnel in 300 feet. The company is erecting buildings and will install a steam plant at once.

The Breck M., M. & T. Co. has been incorporated by Denver people, headed by H. D. McMasters, to mine 125 acres of land near Villa Grove. There are three shafts on the property. The last shipments of ore showed values of \$74 to the ton—50% lead, forty-five ounces silver and about one-half ounce in gold to the ton. The company proposes to run a tunnel 500 feet, which is expected to cut six veins.

SAN JUAN COUNTY.

(Special Correspondence).—The Eureka Exploration Co.—Colorado and Iowa people—own the Ridgeway, in Maggie gulch; the Silver Wing, on the Animas, 2 miles above Eureka, and the Frederica, in Burns' gulch, on the opposite side of the Animas from Picayune gulch. The Silver Wing and Frederica are to be operated through the same tunnel, now in 1700 feet, which will be driven 3000 feet farther, cutting through the Silver Wing grounds into the Frederica. It will cut the latter at 1550 feet depth. The Frederica is now fairly well opened through three levels, the highest and lowest being a vertical distance of 300 feet apart. Near the entrance to the Silver Wing tunnel is a concentrating mill which is being put in condition to operate. The ores of this group carry a silver-lead galena, with a considerable percentage of pyrite. The company is putting in a pipe line on the Animas river to supply water power for mill work.

The Ridgeway is considerably opened up through two levels and produces gold and silver-bearing quartz that is said to carry petzite as one of its mineral species.

This company also operate the Scotia, in Picayune gulch, as lessees. This mine has produced, perhaps, \$75,000.

J. H. Morel and E. C. Van Deist are most active in the management of the Eureka Exploration Co.

The San Juan Queen, in Picayune, is near the Scotia and is being developed by Rasmus Hanson and a Mr. Usher. It comprises eight or ten claims, and present showing is an iron sulphide running well in gold and silver. There are specimens containing native silver.

Additional water power has lately been added to the Sunnyside mill. The plant now comprises two pipe lines—one taking water from the Animas river and the other from Eureka creek. The Animas line consists of 7000 feet of 14-inch pipe; the Eureka line comprises 4000 feet of same diameter. The two heads of water develop 700 H. P. by two Pelton wheels at the mill.

The Eureka line drives all the mill machinery; the Animas line drives an electric generator for light and Durkee

electric drills shortly to be put in at the mines.

The twenty stamps, with amalgamating plates, concentrators and canvas tables, handle over sixty tons of ore daily. The mill capacity is to be doubled by adding twenty more stamps and appurtenant equipment. The ores of the Sunnyside carry some free gold, and gold, lead and silver in zinc, lead and iron sulphides. They are not very siliceous and make a fairly clean concentrate. The material passes from the stamps over the plates, thence over Bartlett tables, thence over Wilfleys, and the final tailings over canvas tables. In this course no attempt is made to classify the material, but it passes as one uniform grade through the mill.

Eureka, Aug. 26.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Ophir Con. M. Co., made up largely of Milwaukee stockholders, own the Silver Bell mine, including forty-five claims at Ophir on the Rio Grande Southern R. R. W. S. Buckley of Telluride is general manager. The mine is opened through four tunnels in the vein. At a point near the railroad, 1900 feet from the mine, a concentrating mill is being completed. It has twenty stamps, four Wilfleys and six Frue vanners. The material will pass from the stamps direct to the Wilfleys which will make a heavy lead product, the tailings being lifted by a sand pump to Spitzkasteus where they are sized for the vanners, the latter making the lighter product containing the iron and copper. The lead and iron carry gold, silver and lead values. The iron will run about 11%, copper 1½%, and silicates 50% to 60%. W. H. Major has charge of the mill and Jas. McWilliams the mine.

The Butterfly-Terrill works about seventy men at the mine and six in their 30-stamp mill. The latter turns out bullion and concentrates. A late cleanup of the former from the plates after a two weeks' run amounted to about \$6500. D. J. Sayer is the manager and J. Nevin millman.

Ames, Sept. 2.

(Special Correspondence).—The Smuggler-Union mills at Pandora comprise the reconstructed Pandora mill of eighty stamps, the new Smuggler of sixty stamps and the cyanide plant, almost completed, to treat the tailings from both the stamp mills.

The Pandora, which has been equipped with new machinery, is now similar to the new Smuggler mill in the method of operating. The equipment comprises stamps, plates, bumping tables, Triumph vanners, Huntingtons and sizers. The main product comes off the bump tables, the tailings therefrom passing to the vanners. The vanner tailings go through sizers to the grinders, thence to Frue vanners. Fifty of the eighty Pandora stamps will operate on the Smuggler-Union ore, the remaining thirty handling the ore from the Contention group, up Bear creek, which belongs to the same company. A tramway is being built from the latter group to the mill. S. T. Elliott, superintendent of the Pandora mill, states that he will soon be handling 130 tons per day of Contention ore, which is quite free milling, being very siliceous and carrying little iron. The Pandora mill is run by electric power.

In the new Smuggler mill the crushed ore, after passing over the plates, falls upon a screen over each bumping table. The oversize passes to Wilfley tables, thence through Chilian mills, over amalgamating plates and then to vanners. That which passes the bump table screens makes the heavy concentrate of the mill, the tailings being carried to the thirty-two vanners on the lower floor, where the finer product is made.

The new cyanide plant, being constructed under the directions of F. L. Bosqui, is enclosed in a building 94x248 feet, wood frame with double truss roof, and siding and roof of corrugated iron. The foundation walls amount to 16,000 cubic feet of masonry. A V-shaped stone sluiceway runs lengthwise through the center, which is 1 foot deep at the upper and 9½ feet deep at the lower end. This will carry away the refuse from the leaching vats. There will be sixteen leaching vats, 8½x40 feet, and two solution tanks, 11x40 feet, giving the plant a leaching capacity of 600 tons in twenty-four hours. The vats, which are built of redwood, are being arranged in a double row on each side of the sluiceway to provide for the double treatment. The upper tier of vats receives the tailings from both mills through automatic distributors, where they are subjected to a short treatment. While the heavier material is settling in the upper vats there is a constant overflow through top gates of slimes which pass to canvas tables, the precipitant on the latter being afterward cyanided. The material in upper vats is dropped through

eight discharge gates in the bottom into the lower vats, where the leaching is finished. The five zinc precipitating boxes are each 24 feet long, 4 feet wide and 3 feet deep. The slimes that come from the mills are estimated to contain gold and silver to the value of \$2 to \$2.50 a ton.

C. W. Van Law, general mill superintendent, is also directing the construction of this company's Contention mill near Silverton.

Telluride, Sept. 3.

TELLURIDE COUNTY.

G. Schlifer of Cripple Creek is owner of the Scottish Chief and other claims near Love, on which a strike is reported that will run \$45 in gold to the ton. At a depth of a few feet a 3-inch shoot was opened and at 40 feet it has a width of 3 feet.

IDAHO.

BLAINE COUNTY.

Fifteen men are employed at the Gladiator and Senate mines, near Galena. A gasoline engine runs a fan to ventilate the 1500 to 1800 feet of tunnel and drifts. In the 750-foot drift two crosscuts 450 feet apart show an ore vein of 15 feet width of concentrating ore, some of which carries 150 ounces silver to the ton.

The Pennsylvania Dev. Co., operating at the Liberal and Maggie May group of mines, has taken up its option on C. W. Courtney's interest, and is now sole owner. Mr. Courtney is continued as superintendent.

IDAHO COUNTY.

A. Arnold, of Pierce City, has sold his half interest in the Fleetwood mine at Pierce City to J. Coach of Port Huron, Mich., who already owned the other half. The mine has been developed to a depth of 250 feet.

At the Dewey mine, Thunder mountain, the tunnel has been driven 300 feet, and the ore, a soft porphyritic material, is the same as at the surface. A crosscut has been run 50 feet in ore that the surface showing indicates has a width of several hundred feet.

A. Kleinsmith, one of the owners of the Old Peacock, White Monument, Helena and other properties in the Seven Devils, it is said, has started a tunnel from the river intended to open up the Peacock mine, 3 miles back from the river, and about 5000 feet above the river bed. The claims are now under bond to the Boston & Seven Devils Co.

Thunder mountain, just now attracting miners and prospectors because of gold discoveries made on it during the past few years, is claimed to be a mountain of ore. It is said that every foot of its surface will pan colors, while within a radius of 50 miles from the original discovery there are many gold-bearing ledges. Placer propositions are numerous, water abundant and the country heavily timbered. As a general thing the ore bodies are low grade, but of free milling character. The importance given to discoveries in this district is because of the immensity of the deposits and the cheapness with which the ore can be mined and milled. Thunder mountain is about 100 miles north and a little east of Boise, and it is proposed to build a State wagon road from that city to the new camp, the cost of which is estimated at \$20,000. Arrangements are being made for the extensive development and operation of some of the most promising prospects and mines.

The Tahoma mine, at Atlanta, has been sold to the Golden Age M. Co., with office in Boise. F. P. Willis has been appointed Supt. A 20-stamp mill will be put on the property this fall, if it is possible to get it in before bad weather begins. The Tahoma has been developed by four tunnels. The lowest one tapped the ledge 400 feet deep and is 1200 feet long. The ore body averages 8 feet wide and, it is claimed, carries values of \$55 a ton gold and \$20 silver.

KOOTENAI COUNTY.

The Weber mine and mill on Lake Pend d'Oreille, owned by F. A. Weber, S. P. Donnelly and A. B. Campbell of Spokane, Wash., is being reopened, and the mill is to be used as a concentrator until some changes are made.

R. Neill, of the placers at Santa camp, near Tyson, says: "There are at present upward of 200 people working at placer mining at Santa and doing well."

LATAH COUNTY.

The White Cross M. Co., of Moscow, have ordered a 5-stamp mill, which it is expected will be placed on the mine ready to start by the last of September.

MICHIGAN.

BOUGHTON COUNTY.

The copper output of the Lake Superior district for the past three years is in pounds as follows:

| | |
|-----------|-------------|
| 1900..... | 148,000,000 |
| 1899..... | 146,950,000 |
| 1898..... | 147,966,000 |

The following is a list of the Lake mines

and the number of stamps that have recently been started and those that will start within the next twelve months: Adventure, 3; Baltic, 2; Champion, 2; Franklin, 3; Isle Royale, 3; Maas, 3; Mohawk, 2; Osceola, 3; Quincy, 3; Trimountain, 2; Wolverine, 2; total, 28. These 28 stamps have each a capacity of 500 tons of rock daily. In 300 days they will be able to stamp 4,200,000 tons of rock, and if it averages to contain 1% copper the aggregate increase in the production will amount to 84,000,000 pounds annually, with allowances for delays and disappointments, but it would seem reasonable to expect in 1902 an increase of 50,000,000 pounds of copper from the Lake region.

MONTANA.

BEAVERHEAD COUNTY.

T. H. Landers and his associates have leased the Golden Era at Argenta and expect to put men at work cleaning out the workings and reopening the mine. The mine has been developed by a shaft 300 feet in depth and a drift 300 feet at the bottom.

FERGUS COUNTY.

The final payment of over \$300,000 on the Kendall gold mine has been made by Finch & Campbell. A tunnel has been run in under the deposit for a distance of 700 feet. Crosscuts show the average width of the vein to be 135 feet. Upraises and winzes have developed the ore body to a depth of 60 feet at the beginning and 250 feet at the further end of the tunnel. The true extent of the ore body cannot be determined as yet, but upwards of a million tons of ore that will average about \$9 per ton are already blocked out. H. Kendall, who receives \$450,000 for the mine and a tenth of the stock in the new company, bought the mine two years ago for \$650, of which he paid \$50 in cash. He took out over \$100,000 before he sold the mine. The expense of mining and milling the ore when the new plant is erected will not exceed \$1.50 per ton.

JEFFERSON COUNTY.

A 35-foot wide ledge of ore has been discovered at Corbin by M. Mulvahl near the old Alta mine. The assays show 11% copper, 30 ounces of silver, 7% lead and \$2.20 in gold.

LEWIS AND CLARKE COUNTY.

A. W. Martin of Helena, owning in the Argo and Canyon Ferry copper mines, near Helena, says his people are about to put in a large treatment plant of their own.

MADISON COUNTY.

The Golden Wedge on Wisconsin creek, at Twin Bridges, was discovered two years ago by the present owners, Hyndman & Haynes. The lead is 2 feet wide between lime and quartzite walls. Ten inches of the quartz is decomposed. Assays vary from \$100 to \$250.

NEVADA.

ELKO COUNTY.

The Contact Copper M. Co. has been incorporated at Salt Lake City, Utah, capital \$40,000. W. C. Coleman is president and H. A. Mercer secretary and treasurer. The company owns the Sulphide mining claims Nos. 1 to 4 in the Little Salmon River mining district.

EUREKA COUNTY.

The Stoddard Bros. have completed the cyanide plant and now have it in successful operation on the Eureka Con. mill site at Eureka. It treats between fifty and sixty tons of ore per week, and ores from the Barton and Cyanide mines on Adams hill and the old Lemon mill tailings are being worked.

LYON COUNTY.

The Lizard mine, near Sutro, has been bonded by San Francisco people. A mill test of the ore gave results so satisfactory that it has been decided to erect a mill at the mine. The formation is decomposed quartz assaying \$10 per ton in gold. It is very soft ground and can be quarried.

NYE COUNTY.

It is reported that the O'Meara lease on the Mispah lode at Tonopah has already produced ores of the value of \$100,000, and promises to add \$200,000 more before it expires. On the Mispah, the pioneer ledge, the ore body is opened up continuously for 1100 feet by shafts varying from 50 to 120 feet in depth, and through drifts that follow a continuous body of high-grade ore. In this stretch are fourteen leases in operation, all ending December 31. The lessees are subordinating extraction to the opening up of the ledge and blocking out ore so that the raising of ore may proceed night and day toward the end of the time limit.

President Anderson of the Tonopah mine, at Butler, says that oral bargains are the only ones made with leasers and witnesses are not necessary. Although there are dozens of leases given to the tributaries, there is not a scratch of the pen

between the company and the leasers. The company receives 25% of the net proceeds, and this sum amounts to \$5000 a day. These leases expire on the last day of December, after which the company will take charge. Two triple-compartment shafts will be sunk immediately to a depth of at least 500 feet. They will be situated 2100 feet apart, where they will cut all the ledges by crosscutting toward each other. At present the company is working the Clark shaft, which is down over 100 feet, and shows 7 feet of ore averaging \$1000 a ton. Every foot of depth brings \$400 to the surface.

WASHOE COUNTY.

(Special Correspondence).—The gross production of the Reno Star mine, at Reno, owned by the Sparks M. Co., is about \$125,000. Nothing less than hundred-dollar is shipped, and at present from one to three carloads are shipped every week. There is over 1000 tons of ore on the dumps, the estimated value of which is over \$80 a ton. As soon as pending litigation is settled, a plant for working the ores at the mine will be installed. A steam hoist, capable of sinking a double-compartment shaft 600 feet, and a Dow sinking pump have just been put in place. The ore body is claimed to be holding its values with depth. The shaft is now down 150 feet.

Over 500 mining claims have been recorded at Reno since Wedekind's discovery of the Reno Star in June, 1900, and a great deal of development work has been done, resulting in the discovery of many promising leads. Many efforts have been made to trace the supposed course of the Wedekind ore body for considerable distances and several shafts have been sunk, but the existence of this lode beyond the limits of the Wedekind claim must still be regarded hypothetical. On the other hand, prospecting for separate deposits has been well rewarded. Practically all formations showing on the surface are of eruptive origin, the primitive rock being covered to varying depths by the superimposed porphyries and quartzites. Through this surface formation rise pipes of extinct thermal springs. Some of these pipes are so highly impregnated with metal deposited from solutions as to be ore chimneys. This is particularly the case where the pipes rise within an otherwise barren ledge, ore shoots being thus produced. These pipes vary in size and are extremely irregular in course, rendering much ingenuity and perseverance necessary in prospecting them. For this reason vertical shafts on these pipes have not been successful. The values found in these shoots are principally silver and lead—the former frequently occurring in gray and yellow chlorides and sulphides, while the lead is found as sulphide and carbonate, carrying good values in silver. Gold is generally present to about 5% proportion of the total value.

An important change of formation which occurs 3 miles north of the town of Reno marks a transition from the silver and lead bodies of the distinctly eruptive country to the copper and gold prospects of Peavine mountain. Granite, syenite, slate and lime replace the porphyries, the line of contact being in some places well defined and productive of valuable ore bodies. Practically, no copper has been found south of this dividing line. North of the line it occurs as carbonate, bornite, sulphate and oxide, with occasional pockets of native copper. Some silver and a little gold is always associated with the copper.

Ramsey's Tally-ho claim, an adjoining prospect to the Wedekind mine, has one 80-foot and one 40-foot shaft, with ore that averages about \$4 in gold and silver. It presents the same surface characteristics.

North of the Wedekind mine about 1 mile is the Crevesser M. Co.'s property. The owners are Lynch, Cohn, Dysart, Tibbets, Rulison and Grant of Reno, who have a shaft down over 100 feet.

The Reno Chance M. Co., R. Eason president, G. W. Perkins secretary and C. Frisch treasurer, is a Reno company which is developing a mine near the Wedekind. A shaft is down 115 feet and shafts will soon be sunk on other lode outcrops.

Two miles north of Reno, W. R. Williams and A. Nelson of Reno have recently discovered a shoot of ore carrying high values in lead and silver. Development is being done by an incline now 60 feet down. The ledge is persistent and ore increases in value with depth.

On the Southern Star claim of Redman & Richardson a ledge carrying silver and lead, the latter as red oxide, has been struck.

Thompson & Frey, on the Rubicon, have a ledge 4 feet wide which at 20 feet depth averages \$8. They are now down 30 feet. Lynch & Bryson are working the Flyer claim. J. L. Simpson is working on the Wild Eye, in which he has bought an interest. Holesworth & Burk

are prospecting the New York and New Jersey claims, 1 mile from the Williams & Nelson property.

Reno, Sept. 6.

M. Sheeline, A. G. Fletcher and Mrs. A. E. Osborn and associates of Reno have bonded to the Senator G. M. Co. at \$50,000, for two years, 120 acres of mineral land at Steamboat Springs. The Senator Co. have deposited \$5000 as security for continuous work. Mr. Ogden has been appointed as superintendent. The theory of the company is that a large quartz ledge of great richness underlies the deposits of the geysers. The formation has been cut on an adjoining claim with a diamond drill and assays of borings yielded from \$1700 to over \$4000 in gold. A double-compartment shaft is now being sunk.

Supt. A. E. Murdock of the Last Chance mine says that the incline is down over 190 feet, all in ore. A new incline will be made some distance away and a connection run to the present workings to supply air and determine the extent of the pay shoot.

At the Black Horse mine at Cambridge Mr. Deitrich is completing the construction of the 2-stamp mill and expects soon to be operating it.

The Monte Carlo mine is 3 miles east of Washoe City, and rich copper ore has been struck. C. F. Mickall is Supt.

C. E. White of Philadelphia, Pa., and H. H. Barbee of Colorado Springs, Colo., have taken an option on the plant of the Reno M. & S. Co. at Reno, and expect to buy it and have the smelter running within sixty days.

NEW MEXICO.

GRANT COUNTY.

T. W. Carter is driving a 100-foot tunnel on his Copper Jacket claim at Burros, and expects to cut the vein, which has good surface cropping at the 100-foot depth.

R. P. Thompson and B. F. Copp have an 18-inch vein of ore on their Virginia mine at Burros, at a depth of 70 feet, that they claim runs 25% copper.

E. G. Maroney, D. Shay and J. H. Bates have sold the Irish Gray, Bison, Treasure and Fortune at Burros to Silver City parties. All of the claims show good surface croppings of copper ore, and the new owners expect to commence development work at once.

LINCOLN COUNTY.

A San Antonio, Texas, company has bought twenty-three copper claims near Estey City, in the Oscura mountains, and is putting machinery on them.

New machinery is being installed in the Turkey Creek mines, near Nogal, and the owners, the Iowa & New Mexico D. Co., intend to do considerable development work.

Three Nogal men have bought the Parsons mine at Nogal for \$10,000. A mountain of free milling low-grade gold ore is included in the twenty-five claims. The new owners expect to put in a plant that will save the values at low cost.

OREGON.

BAKER COUNTY.

It is stated that the Bonanza mine, near Baker City, is to have a plant with a capacity for sinking a triple-compartment shaft 2500 feet.

GRANT COUNTY.

The owners of the Cougar, near Granite, have incorporated with an office at Spokane, Wash., to operate the mine, which includes four claims. There is a long tunnel of 1000 feet along the vein and considerable surface work has been done. The mill has a capacity of 250 tons daily, but does not work satisfactorily. D. R. Evans, president, says that the company will put in a roasting plant. H. D. Crow is secretary and J. W. Larkin is manager.

It is reported that the Virtue mine and the Con. Virginia, near Baker City, owned by D. Keith of Salt Lake City, Utah, are to be consolidated under one management. Recently a pocket was opened up in the Virtue which was about half gold.

JACKSON COUNTY.

Miller & McDonald, who have bonded the Cox & Lyman ledge, situated near Gold Hill, have made another rich strike, and a large amount of gold has already been taken out.

JOSEPHINE COUNTY.

The Lucky Cuss mine of the Williams Creek district, near Grants Pass, has been bonded by McCann & Strickland. The new company proposes to work the mine on a larger scale than heretofore.

UTAH.

BEAVER COUNTY.

The B. W. & H. G. & S. M. Co. has been incorporated at Richfield; capital, \$100,000; J. M. Billingsly is president and J. H. Wells secretary and treasurer. Joseph is the principal place of business.

BOX ELDER COUNTY.

The Dove Creek M. & M. Co. has been incorporated, capital \$40,000. The company owns the Manchester, London and other mining claims at Dove creek. L. H. Young is president and J. A. Young secretary and treasurer.

The Deer Trail G. M. & M. Co. has been incorporated at Salt Lake City, capital \$30,000; H. Denhalter is president and C. H. Hipp secretary and treasurer. The company owns the Denhalter and five other mining claims in Park valley.

PIUTE COUNTY.

The Adelborn M. Co. has been incorporated at Salt Lake City; capital, \$15,000; C. H. Scott is president, B. B. Corbin secretary and treasurer, and B. T. Ashley Supt. The company owns the Last Dollar and twelve other mining claims in the Mount Baldy mining district.

SALT LAKE COUNTY.

The Bingham C. & G. M. Co., known as the Commercial group of Bingham, are to be opened by a new tunnel 1700 feet long. O. P. Posey, manager of the company, has called for bids on the work.

SEVIER COUNTY.

A deposit of kaolin, near Glenwood, is being investigated. It is owned by H. J. Gottfredson, C. J. Hansen and J. Crosier of Richfield.

TOOELE COUNTY.

The Don Pedro M. & M. Co. has been incorporated, capital \$5000. J. H. Palmer is president and L. F. Peer secretary and treasurer. The company owns the Ute and five other mining claims in Rush valley.

WASHINGTON.

FERRY COUNTY.

J. Cronin, operating the Phil Sheridan mine at Sheridan, near Republic, says that the first shipment sent to the smelter from the mine yielded \$100 per ton in silver and gold, but the cost of the wagon haul, smelter charges and other expenses left only a profit of \$30 per ton. The ore can be treated on the ground for about the present smelter charges.

There are 3 feet of ore assaying from \$25 to \$35 per ton in the 40-foot deep winze sunk from the Great Republic tunnel. The Great Republic is on the west slope of Malde mountain, 1500 feet south of the international boundary line. The mouth of the tunnel is 30 feet above and less than 100 feet distant from a railroad track. The mine was first located in 1894 by C. C. Knutson and R. Malde of Roseland, B. C., who recorded it in Roseland, supposing it to be in British Columbia.

The shaft of the Trade Dollar at Republic has been sunk 210 feet. The ore body is about 3½ feet wide. The ore is of shipping grade.

Supt. W. M. Crummer of the Gold Ledge mine says he has let a contract to drive the tunnel on that property a further distance of 325 feet. The plan is to cut the ledge at a depth of about 350 feet.

WYOMING.

ALBANY COUNTY.

A. F. Whitman has discovered near his copper mine in Plumbago canyon, 30 miles north of Laramie, a deposit of asbestos. The vein he states to be 10 feet in thickness and free from mica. Denver people are negotiating with Mr. Whitman to develop the property for a share of the output.

FOREIGN.

BRITISH COLUMBIA.

The Prospectors' Exchange of Nelson says: The Vicking M. & Dev. Co. have bonded the Phoenix group, Slocan, and will start operations on an extensive scale.

The last shipment of thirty-three tons of Wonderful ore, Slocan, averaged \$80 per ton.

The Hewitt mine, Silverton, is shipping about 100 tons of dry silver ore per week, running from 100 to 150 ounces in silver and from 1% to 5% lead. The mine is now opened to a depth of 450 feet. A 1000-foot tunnel, now in 350 feet, when completed will enter the ore bodies at a depth of 900 feet.

A strike has been made on the Fisher Maiden at Silverton of 8 feet of dry ore, running 125 ounces silver to the ton.

H. Eller and D. Munroe have made a strike of gold quartz on the Follow Me group, Fort Steele district. The ledge is from 40 to 50 feet wide, lying between walls of slate and syenite, and shows free gold.

Nelson, Sept. 5.

The Relief G. M. Co., capital \$250,000, has been incorporated at Spokane, Wash., by J. A. Finch, A. B. Campbell, R. K. Neill of Spokane, B. Todd of Youngstown, Ohio, and H. Wick of New York. Mr. Campbell states that they have incorporated the old Relief mine, 13 miles from Erie, of which they had been trustees for a number of years. The stamp mill under construction will be completed

and running in about three weeks. This mine is a free-milling proposition.

The Hartford M. Co., capital \$900,000, has been incorporated at Grand Forks to operate the Hartford fraction, Ranger, Nabob fraction, Golden Eagle fraction and Golden Crown fraction, all of which are situated in Wellington camp. The provisional directors are S. H. C. Miner, J. H. McKechnie, Granby, Que.; A. C. Flumerfelt, H. N. Galer, Grand Forks; A. L. White, D. Louson and W. A. Matley, Montreal. Thus far about \$12,000 have been expended in development work. A shaft 100 feet deep and a drift 125 feet long are all in ore on the Hartford claim.

Personal.

S. WRIGHT of Virginia City, Nev., is at Signal, Ariz.

HENRY BRATNOBER, of London, is in San Francisco.

M. CURRAN has been appointed Supt. Alice mine, at Wallace, Idaho.

A. D. GASSOWAY of North Bloomfield, Cal., is sojourning in San Francisco.

VICTOR M. CLEMENT has returned from Mexico to Salt Lake City, Utah.

H. MURRAY is manager of the Dudley drift mine at Forest, Sierra county, Cal.

S. T. PEARSON has been appointed manager of the Nevada Co. at Austin, Nev.

O. COFLIN has been appointed superintendent of the Green Mountain mine at Grass Valley, Cal.

L. D. BALL, superintendent of the Yreka M. & M. Co. at Sawyers Bar, Cal., is in San Francisco.

B. F. JAMES of Oakland, Cal., has returned from quartz mining operations in Ecuador, South America.

G. W. TIBBITS of Denver, Colo., was at Gila, Cal., for some days last week examining mines at that place.

R. M. CATLIN, general manager of the Transvaal mines of the Consolidated Gold Co. of London, is in San Francisco.

M. GALLAGHER, Boise City, Idaho, has been appointed superintendent of the Oriental M. Co., operating in Korea.

A. FLOOD, formerly of Virginia City, Nev., has been appointed superintendent of the O'Farrell cyanide mill at Missoula, Mont.

H. L. HUSTON has gone to Mexico to develop some copper claims near Hermosillo, Sonora, for Benjamin, Meredith & Wynne.

F. P. WILLIS of Boise has been appointed superintendent of the Tahoma mine, owned by the Golden Age M. Co. at Atlanta, Ida.

Commercial Paragraphs.

THE Calumet & Hecla Copper M. Co., the largest copper mining company in the world, have ten Cross oil filters in successful use in their mines. They were furnished by the Burt Mfg. Co. of Akron, O.

THE 60-page illustrated catalogue published by the Smooth-On Mfg. Co. is interesting and instructive. It tells all about different Smooth-On cements, what Smooth-On is, how used, gives illustrations of its use and tells why it is valuable to the engineer, machinist, iron and steel founder, steam fitter and plumber. Send for a copy to 34-36 Steuart St., San Francisco.

THE contract for the ten large Corliss engines to furnish electric power to the Subway Railway in New York City has been awarded to the Allis-Chalmers Co., and will be built by the E. P. Allis branch at Milwaukee. These engines are to be of the combined horizontal and vertical type, and are rated at 8000 H. P. each at most economical point of cut-off. They are pronounced capable of operating continuously under a load of 12,000 H. P. each.

SITUATIONS WANTED.

MILL BUILDER open for engagement on design or construction of stamp mill or concentrator. Technical education. Ten years' experience. Address S. T. F., this office.

WANTED.—Position with a dredge placer mining company who desire a practical dredge operator and machinist. Good references. Address J. D., care Mining and Scientific Press.

YOUNG GRADUATE MINING ENGINEER desires appointment as surveyor, assayer, or assistant to superintendent. Four years' experience in lead, tin, copper and gold mining. Good references. Apply L. T., this office.

WANTED.—A position as superintendent of quartz mine. Have had years of experience. Can do anything about a mine or mill. Know the value of a dollar in labor or material, with common sense to back me. No objections to go to South Africa, Corea or Mexico. Can give references. Address Box 30, this office.

WANTED.—Position as Manager or Superintendent of mining property in the United States or Mexico. Speak and write Spanish. Many years' experience and thoroughly practical. References. Address Box 237, Mining and Scientific Press office.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

Mine Foreman or Superintendent.

Young man (32) with twelve years' practical experience in South Dakota, Arizona, California, Idaho and Montana; thorough knowledge of up-to-date mining methods and a fair technical education, desires position as mine foreman or superintendent. First-class references. Address "Cuprite," Box 1182, Butte, Mont.

MINING ENGINEER, graduate Mass. Inst. Tech., with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

SITUATION WANTED BY A YOUNG MAN with technical education and ten years' experience in Montana, California and Arizona. Was assistant superintendent in an Arizona copper camp and had charge of the bookkeeping, chemical work, assaying, purchasing of all supplies, and development work. Just resigned from charge of 20-stamp mill. Thoroughly understands cyaniding in San Francisco for a few days. Address L. E. P., care Mining and Scientific Press.

WANTED.

WANTED IMMEDIATELY FOR ARIZONA. COPPER BLAST FURNACE FOREMAN. Experience with Mexican labor necessary. Rate \$5 per day. Address "Matte," Mining and Scientific Press office.

WANTED.—Practical Mine Foreman for development work. New property on coast, S. E. Alaska. Must be all-round miner, tool sharpener, and perfectly sober. Go to opening for right man. Give experience, age, references, etc. Address "Foreman," care Mining and Scientific Press.

WANTED.

Placer Ground of Every Description, with or without Water, and Gold-Bearing Beach Sands. Also Low-Grade Gold, Silver and Copper Property, whose values are difficult to extract. Address HEINTZ GOLD EXTRACTION CO., 417 Templeton Building, Salt Lake City, Utah.

WANTED IMMEDIATELY.

A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop.

Excellent chance for the right man to better his position, if satisfactory. Answer by letter to F. C. JURS, 1149 Van Ness Ave., San Francisco.

Platinum Metals

are heavier than gold, tin-white and usually occur in small veins and do not amalgamate. They are valuable. Send for sale to Welsbach Company, Broad and Arch Sts., Philadelphia, Pa. Analysis free. For information concerning methods of saving the metals, write to the Waratah Minerals Company, Limited, 140 Ellis St., San Francisco, Cal.

BRITISH COLUMBIA MINES.

Mines and prospects in British Columbia and the Northwestern States.

Free-milling Gold properties on very reasonable terms. Excellent chance for profitable investment in legitimate mining.

Correspondence solicited. Address ANDREW F. ROSENBERGER, P. O. Box 700, Nelson, British Columbia.

MICHIGAN COLLEGE OF MINES.

An Engineering School with unique location, giving it unusual facilities. Distinctive methods of instruction. Special courses given. All work in charge of widely experienced men. Catalogue giving list of graduates and their occupations on application. Address

F. W. McNAIR, Pres't, Houghton, Mich.

FOR SALE.

CHAS. E. BILLIN & CO.,
CHICAGO, ILL.

Solicit correspondence from parties having for sale complete

Mining, Milling, Smelting,
OR OTHER PLANTS.

We will purchase for cash if in good condition.

We purchased last spring and have dismantled and resold the Diamond Hill mill, 120 stamps, vanners, water power, etc. Montana Gold Mining Co., 6 Huntington mills, power, etc.

FOR SALE.—A First-Class Gold Cyaniding Proposition,

WITH MILL PARTLY BUILT. Address Box 101, Mining and Scientific Press.

FOR SALE.—Two Claims with a Large Body of Ore in Sight, Averaging \$10.

Easy terms. Small amount of development. Address Box 100, care this office.

FOR SALE. THREE ROOTS ROTARY PRESSURE PUMPS.

Capacity from Eight to Thirteen Thousand Gallons per Minute. Reference Mr. Frank Klepetko, Butte, Mont.

P. H. & F. M. ROOTS CO., Connersville, Indiana.

HOISTS.

Twenty different makes of Hoists. All rebuilt and sold under guarantee. We have the largest stock of second-hand Hoists in the West.

Send for Catalogue No. 37.

THE S. H. SUPPLY CO.,
22nd and Larimer Sts., DENVER, COLO.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

OLD BUILDINGS
and CRANES of

The Risdon Iron Works,
SAN FRANCISCO, CAL.

FOR SALE, FOR REMOVAL,

Consisting of machine shop, foundry and boiler shop buildings, suitable for these purposes or for warehouse or storage buildings. Proposals received now and up to August 1st.

Bargains in Water Wheels.
—WRITE THE—
ALLIS-CHALMERS CO., Chicago, Ill.

For prices on the below described Turbines which are practically new, have never been in use and are guaranteed to be in first-class condition.

ONE PAIR 23" LEFFEL TURBINES, complete with iron casing, iron frame, governor and shaft coupling for direct connection; wheel to develop 500 H. P. at 460 revolutions with 50' effective head.

ONE 26 1/2" LEFFEL TURBINE WHEEL, complete with iron casing, iron frame, governor and pulley. This wheel to develop 180 H. P. at 346 revolutions under 50' head.

ONE 23" LEFFEL TURBINE, complete with iron casing, iron frame, governor and pulley. This wheel to develop 100 H. P. at 398 revolutions under 50' head.

THESE ARE RARE BARGAINS AND SHOULD BE TAKEN ADVANTAGE OF.

For Immediate Shipment.

One 18-18 x 18 Duplex Steam Actuated Compressor.

One 10 x 12 Reversible Geared Hoisting Engine with Steam Actuated Clutch Drum.

We also have on hand a complete line of Standard Boilers.

Write us for prices and specifications.

BRADLEY ENGINEERING & MACHINERY CO.,
SPOKANE, WASHINGTON.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

ERICSSON TELEPHONES
are strictly "High Grade."

They are sold on their "merits only."

Especially recommended for mining work.

Write for Net Price List and References.
We Sell Any Part Separate.

Electric, Railway and
Manufacturers' Supply Co.,

PACIFIC COAST AGENTS,

68-72 FIRST ST., SAN FRANCISCO, CAL.

A. M. DONALDSON & CO.,

Assayers and Waste Product Smelters,

1661 Larimer St., Denver, Colo.

Pay Cash for Mill Wastes, Iron Amalgam Chips, Gold and Silver Retorts, Old and Surplus Quick-ilver, Gold and Silver Wastes. ZINC SHAVING MANUFACTURER. Fresh cut always in stock. TELEGRAPH orders solicited.

MINERS' AND PROSPECTORS' GUIDE

REVISED THIRD EDITION.

Published by JAMES IRVING & CO.,
128 N. Main St., Los Angeles, Cal.

Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

Price 25 Cents.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 24) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 223 Crocker Building, San Francisco, California.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 7th day of September, 1901, an assessment (No. 25) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—217 Sacramento street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 19th day of August, 1901, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 301 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 301 Claus Spreckels Building, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Arizona, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 28th day of August, 1901, an assessment (No. 12) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—307 Montgomery street, San Francisco, California.

ETNA PETROLEUM COMPANY.—Principal place of business, San Francisco, California. Location of works, Fresno County, California.

Notice is hereby given that, at a meeting of the Directors, held on the 22nd day of August, 1901, an assessment of ten (10) dollars per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, No. 316 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on the 14th day of October, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office—No. 316 California street, San Francisco, California.

WILLIETTA MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 13th day of August, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 8, 206 Sansome street, San Francisco, California.

DIVIDEND NOTICE.—JAMISON MINING COMPANY.—By order of the Board of Directors, at their meeting on September 6th, 1901, a dividend of \$1.00, being three (3) cents per share on the capital stock of the company, will be paid at the office of the company, Room 56 120 Sutter St., San Francisco, Cal., on Monday, September 23rd, 1901. Transfer books will close at noon on Saturday, September 21st, and will be reopened at nine o'clock on the morning of Tuesday, September 24th. On the written request of any stockholder addressed to the secretary, check for the amount of dividend on stock standing in his name will be mailed to any address given.

Office—120 Sutter St., San Francisco, Cal.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine. CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground. The actual capacity of our machines is, under favorable conditions, from $\frac{1}{4}$ to $\frac{1}{2}$ greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Boise ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

A COUPLE OF PROSPECTORS, NOW IN San Francisco, lately up from Mexico, know of a big oil region there, the land of which can be purchased for 25 cents an acre. Would like to meet parties interested. Address Box 15, care Mining and Scientific Press.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from A. E. Jones, in the Hamilton Placer Mine, near Johnsville, Plumas Co., to deposit tailings in Nelson Creek; from Ellen C. Sargent et al., in the Quaker Hill No. 2 Mine, at Quaker Hill, near Nevada City, Nevada Co., to deposit tailings on a flat below the mine; and from the Calaveras Mining, Water and Power Co., in the Round Butte Placer Mine, near Sheep Ranch, Calaveras Co., to deposit tailings in O'Neill Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 30, 1901, at 1:30 p. m.

SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light
EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

WATER PROBLEM SOLVED

We solve your mine pumping problems. Our engineer makes a personal survey of your property. He listens to all your pumping troubles and takes notes of all the things that the old pump won't do. Then we figure on the conditions. Our long experience enables us to arrive at absolutely correct conclusions. We submit plans and cost. If we get the order we build the pump and install it. If the machine doesn't do the work you don't pay for it, that's all. We guarantee results.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

Pacific Mail Dock==roofed

with
P & B
Ready
Roofing

This is one of the largest buildings on the Pacific Coast, containing over 140,000 square feet of roof surface. It is roofed with light grade of P & B Ready Roofing, laid over the shingles. This roofing was laid on over 8 years ago and though it has been exposed to unusually rough wear and abuse, it is still in good condition and has never required any repairs or expense. The superintendent of the dock is highly pleased with the excellent service of P & B Ready Roofing and says that the entire roofing cost was repaid the first winter in the saving of damage charges, usually consequent on rains.

It never leaks, flakes off, rusts out, cracks from cold or runs from the sun. Smoke, fumes, soot, gases, rain, fog or fire do not interfere in the least with P & B Ready Roofing—it goes right on wearing and giving good service. Send for booklet—address Department A.

Reno Mining District, Nev.

To those who knew Nevada in the old times, between 1860 and 1890, the Nevada of 1901 has all the difference and novelty of a newly discovered country. The idea that Reno, the railroad junction where you changed cars the morning after you had left San Francisco en route to Virginia City, is the center of a mining district of a present importance equal to the Comstock, and of a prospective importance greater than the Comstock, is not readily grasped.

The old Nevada in the minds of men centered around Virginia City, illustrated on this page. When the gold and silver output of its mines dwindled away toward the vanishing point, the belief of people, even of those who remained in the State, disappeared with it. Years have had to elapse to bring back some of the old faith, and with it some new work, to show to new people, as well as the old, that Nevada still has fortunes in her mines of metal for those who seek for them.

Reno is not the only district in Nevada where new mines are being found. By those who have thought they knew the reserve mineral possibilities of the State it would, however, have been selected as among the least likely localities to become a mining district. As late as 1895, in publications descriptive of the resources of the several counties of Nevada, the mineral possibilities were considered of so little consequence as to be unmentionable.

The illustration of the city of Reno on this page is suggestive of farms and homes rather than of mines. Aside from its position as a railroad junction, the place has been the center of by far the larger part of the agricultural industry of Nevada. The discovery and development of the mines takes nothing away from this established industry. It does not change what exists, but adds what did not exist.

Virginia City, Nevada.

Reno naturally is expanding and gaining under the new impetus. Washoe county, which this year for the first time has a mineral production exceeding its agricultural, is finding its wealth-producing resources more than doubled.

Like many other mining districts, Reno owes its present distinction to the persistence in prospecting of a man who believed in his own knowledge, and who refused to accept as a fact the opinion of the great majority of the Reno people that there could be no mines where he was looking, because no one had found any. George Wedekind found at last what he was looking for, and his success not only started the great majority in search for other mines, but it has given confidence to the owners of many older pros-

pects under the stimulus of which many of them are being developed into mines.

Looking at the results after their accomplishment, it seems strange that they were not anticipated. Virginia City and the Comstock are barely 20 miles away. Steamboat Springs, remnants of the mineral-bearing thermal waters that accompanied the building of the Comstock lode, are only 6 miles away. The same plutonic rocks exist at Reno as at Virginia City, and mineral-filled pipes of dead fumaroles are to be found near Reno that show a former extension of the Steamboat Springs region. To carry the comparison further, the ores found are of a grade and mineral character similar to the old surface ores of the Comstock. Nothing so rich as the Comstock

has yet been found, but the kind of ore and rock conditions permit of the hope for large and rich ore bodies. There is evidently at Reno much less denudation than at Virginia City. The old surface, in fact, appears to be covered with float from higher rock masses. Bonanzas can hardly be looked for at the surface.

Reno, if a long time in realizing that within her own limits there was metal wealth, is now backing the knowledge of it with her own capital, and will realize its profits. Twenty or more associations of Reno business men are developing promising prospects. The original discovery of Wedekind is being exploited under local ownership. Its production has already added nearly \$150,000 to the permanent wealth of the district.

The development of the mines of Reno district would now seem assured under conditions giving the profits to the enterprising people of that community. The city itself is as typical of new Nevada mining as Virginia City is of old Nevada mining.

THE making of a great copper mine is an affair of many months, if, indeed, it is not many years. The technical and business importance given to the very large copper mining and metallurgical operations has tended to discount commercial operations on a small scale. There is no real occasion for this. Small copper mines can be put into the producing stage in a reasonable time. The operation of a small mine can be made profitable. The economies of production can be applied and taken advantage of by the small mining operation to very nearly the same ratio of efficiency as the large one. The small operation is not necessarily dependent on the smelting and refining plants of the big operations to have its ores reduced to metal. There are lixiviation and even smelting methods which can be economically employed in small units and which are not costly of installation. Experiment and invention are making rapid advances toward providing cheap and efficient processes for small mines and small capital. The investor must not overlook the necessity for the continued application by him of the same exact business and technical methods which have made large copper mining operations so profitable. Big works can grow out of little works, but exactness of technical methods and fidelity to sound commercial principles must be the basis of operation of the little works.

In this issue there is a paper written by Jesse Scobey of Denver, Colo., on "Sampling Mill Work," that fills up one of the vacant places in the hitherto published writings descriptive of exact mining and metallurgical methods. It is a fact that the efficiency of processes of metal recovery from the mine run of ore expressed in percentages are more often guesses than otherwise, and not very good guesses either. The sources of error, as Mr. Scobey correctly indicates them, are inaccuracies at the beginning of ascertainment of the facts. The ore weights are not accurately determined, nor is the sampling of the mine run of ore certainly effected. The system, which is explained by Mr. Scobey for obtaining the factors from which efficiency of work is determined, is simple, and is independent of the sources of error noted above. While devised particularly for sampling the work of a concentration mill receiving mine run of ore and delivering concentrates by rail, it can be modified to permit of application to work where the mine cars deliver ore directly to the mill ore bins. The principle which it applies, exactness in measuring quantities, commends itself to the attention of mine operators and managers. Applied by Mr. Scobey's method, it makes possible the close system of records and cost keeping of separate openings in the mine, and of separate machines in the mills that this paper editorially advocated in last week's number.

The Assassination of President McKinley.

Thrice within four decades this country has lost its Chief Executive by the all too skillful stroke of the assassin. Thrice has a loving people been plunged in the depths of grief and mourning at the behest of envenomed hate, of lunacy and of anarchy. Thrice has the deed been profoundly deplored and the doer received universal execration and repudiation. In no case has the murderous wretch been cheered by the faintest expression of satisfaction. Two have gone to their graves unwept and unhonored and the third will quickly follow; though it must be owned, with the bitterest chagrin, that our latest abomination may be less desolate of approval than his predecessors. Anarchy has risen to the light of day in this free country as it dared not in other lands, and perhaps the most difficult question which has arisen in the history of the American people now demands solution. Manifestly, freedom is not for all, but for those who merit it. How shall the priceless boon of liberty be preserved for these by its withholding from the others? American statesmanship and humanity have never faced a more difficult question.

It is not surprising that in the more recent experience of the American people foreign commentators read the failure of our proudest ideals. It is not surprising that the London Globe of last Saturday says: "Out of ten Presidents since 1861, three have been assassinated. The percentage is appalling and cannot be paralleled in any civilized State since the days of the Roman empire. If the Presidential chair is not to be regarded as an ante-room of a funeral vault, some very stringent precautions will have to be resorted to. The days of republican simplicity, when the President mingled with his fellow citizens, have passed forever." If this, indeed, be true, if we must forsake the traditions of the republic that the President is always one of the people—an elder brother, with the same right to liberty in his personal movements, safe from the murderer as we are, and free to participate with us in occasions of public interest and rejoicing—then, indeed, sad disappointment will come upon us all. Such a conclusion will not be reached quickly nor easily while there are brave men to meet danger in support of what they conceive to be a manifestation of faith in an American principle.

One of the first deeds of President Roosevelt after he, with deep feeling, took the oath of office on Saturday last, is thus described by telegraph:

The President, after the meeting of the Cabinet, saw a few personal friends, and then, putting on his hat, said to Secretary Root:

"Let us take a little walk up the street and back again; it will do us both good."

Secretary Root assented. When they came to the front walk the police and detectives in citizens' clothes started to follow him. He turned and told them that he did not desire any protection. "I do not want to establish the precedent of going about guarded," he said.

Every American will honor the new President for his declaration that the traditions of the republic must be preserved. He evidently does not desire to sacrifice his right of personal freedom, nor to sacrifice by official cowardice the personal bravery which every citizen should possess.

This may seem a little thing, but it is in fact a very great one. All our Presidents have gone about where honest men have a right to go, and they all should and shall do so in the future. This matter really involves the whole national attitude between our people and those whom they choose to rule over them. A secluded ruler, a ruler afraid of the people, are things abhorrent to the American idea, and if such conceptions of our rulership and our citizenship should be allowed to prevail, we should bid farewell to many things which now constitute the essential principles of our governmental system. A ruler out of sight, a ruler hedged about by protective artillery; it is such which human progress is passing beyond. There must never come a time when a President of the United States cannot say: "Come, let us take a walk up the street and back again; it will do us good."

Well, if not this, what then? Evidently the citizenship of this country must be purged. We have grown careless during the later years of wonderful prosperity and development. We have gloried in

the fact that American patriotism would drive every foreign fervor from the blood of those who come with in its influence. So, indeed, it will with all save one, and that is not fervor but fever, and must be resolutely and searchingly driven out of the hearts of men, or they must pay the penalty of treason. Not only must the gates be closed to all immigration not clearly desirable, but public sentiment must drive out of the country all of the anarchy breeding kind we now have among us. In this country, as events have shown, there is no danger of infringement of liberty, but there is danger of carelessly promoting license. Every intelligent citizen knows the difference between free discussion and vigorous denunciation of public wrong doing and the beliefs and methods of anarchy. Fortunately, the distinction is so clear that a wayfaring man, though a fool, need not err therein, and if he choose anarchy let him know that he will be crushed beneath the heel of the American people. That such is the will of the people there can be no doubt nor misgiving. If there be any excuse or palliation for anarchy anywhere, there is none under the American flag.

SAN FRANCISCO has been a storm center of strikes this season, greatly to the injury of the cause of honest labor and to the detriment of the manufacturing interests. With mistaken notions of liberty—the bitter fruit of blossoms blown to us from across the seas—some of the strikers seem to think that they can quit their jobs and yet command them; can refuse to work and yet dictate who shall or shall not take up the work they have rejected. No man can throw away and keep a thing at the same time, and though he may terrorize or destroy he cannot permanently win in an attempt to prevent others from doing the necessary work that he refuses to do. The men that beat others who want a peaceful chance to earn money; the men who poison horses and destroy their former employer's property have no conception of liberty or the rights of man, and are doing labor and labor unions more injury than the worst enemy of labor unions could devise. Liberty is not lawless license: liberty is "the right to do as I please provided I do not interfere with my neighbor's right to do as he pleases," and "if I relinquish a job I have a right so to do, and my neighbor has just the same right to take the job that I threw away." Rightly run, labor unions are a help and in numberless instances have shown abundant good reasons for their existence. A properly conducted labor union is of benefit to employe and employer alike. The trouble is that in their zeal to unionize those who decline to be unionized many members of labor unions forget that while they have equal rights, they have none superior to others, and the better members remain silent when such despotic un-American methods as those now practiced in San Francisco are carried on. While intelligence controls a labor union it is a good thing; when run by a mob it becomes a menace to mutual prosperity and to free institutions.

THE General Land Office ruling that gilsonite in Colorado must be located as a lode, and not as a placer, may be used to support some novel contentions in the California petroleum districts. The line between gilsonite and asphaltum is not sufficient to make a legal difference between them when it comes to a rule for making locations. Bituminous rock is simply a low-grade asphaltum deposit. It has, however, a commercial value nominally exceeding mining costs and is a mineral a deposit of which is locatable. Petroleum, asphaltum and bituminous rock occur together in the same lands in California. Heretofore the locations have been made as placers for petroleum. As asphaltum and bituminous rock are legally lode deposits, the placer locations cannot hold them. They are subject to location over the placer locations by the operation of the same law which provides for the location of gold-bearing quartz lodes on placer claims. While it is not probable that many placer petroleum claims are subject to lode location over them, some of them certainly are. It would seem desirable that, instead of chancing a possible reversal of the ruling by the courts, the owners of such jeopardized claims should protect them by making lode locations of asphaltum and bituminous rock outcrops. Better to do that than incur the costs of contest with some one else who might locate them and initiate an extralateral right litigation for which there are no precedents.

Concentrates.

THE specific gravity of Portland cement carefully dried should be between 3.1 and 3.25.

THE tenth annual session of the California State Miners' Association will be held in San Francisco on October 21st, 22d and 23d, 1901.

WITH sandy gold ores, largely fine stuff, a mill of the roller type will put out through more material with the same power consumption than stamps.

UNDER ordinary working conditions the percentage of the total ore fed to a stamp mill that will be crushed finer than 100 mesh will vary between 28% and 40%.

ACETYLENE is reported to have been used in mine illumination at a considerable increase in the quantity of light, accompanied with a decrease in cost as compared with candles.

TOOLS should never be sent down or out of a mine shaft in a hoisting bucket without being securely fastened inside of it.

A STRAIGHT EDGE to a drill bit throws too much work on the ends. The edge is properly made rounding to distribute the work. The curvature is modified by the character of rock being cut.

CARIBOO, B. C., GOLD runs from \$17.10 to \$18.47 to the ounce. Dawson gold runs from \$15.50 to \$16.50 to the ounce, and beach sand gold from the north end of Vancouver island \$17.87 to the ounce.

THE best specimens of strontium minerals in the United States have come from a cave found in western Ohio near Lake Erie. The entire deposit of large crystals was removed and sold for cabinet display.

ONE POUND of petroleum, .920 gravity, free from water, sand and clay, will evaporate as much water in a steam boiler as two pounds of anthracite, two and one-quarter pounds of ordinary bitumen coal or three and one-half pounds of lignite.

GAS has been made in Los Angeles, Cal., from petroleum distillate that cost 14 cents per 1000 cubic feet. Tested in a gas-burning furnace, a piece of cast steel $\frac{1}{2}'' \times 4'' \times 18''$ is claimed to have been brought to the fluid point in ten minutes.

THE U. S. Circuit Court, by Judge Beatty, has ruled that a mine foreman is a fellow servant under the law and that injuries received as a result of his neglect or carelessness are not a ground of action on which recovery can be had against the owners of the mine.

THE abundance and cheapness of capital is contributing a great deal to effecting the substitution of electric power for steam for operating mining plants. The interest in the machinery is found to be less charge than the current cost of fuel and the labor required to handle it.

THE custom in Alaska of designating claims by numbers, above and below discovery, is a system of identification which has been adopted from the Canadian custom followed in the Klondike. It is particularly convenient in assisting the tracing of titles through the records.

AT the North Star mine, Grass Valley, Cal., a red-wood stave pipe wrapped with galvanized asphaltum-dipped wire is used as a conduit for telephone wires in the 1600-foot deep shaft. This wood pipe was used as a substitute for metal pipe, which could not be had on account of the strike.

THERE is a very large and increasing consumption of mica in the United States. Mica in clear sheets, 4x4 inches in size and upward, is worth from \$1 to \$3 a pound in New York City. Eugene Munsell & Co., 218 Water street, New York, are dealers in this mineral, and samples can be sent to them.

THE coal miners of the Tennessee Company in Tennessee are paid a price for digging coal dependent on the price at which the company sells its pig iron production the preceding month. If the price of pig iron increases the price paid for digging coal increases with it. If pig iron sale price decreases less is paid for digging coal.

WITH a very low discharge through the screen of a stamp battery there is always a chance for excessive scouring of the amalgam from the plate on the chock block. Amalgam is driven out through the screen and some loss is apt to result. For this reason some mill men use no inside plates at all where they employ a low screen discharge.

SILICA CEMENT or sand cement is manufactured by grinding together equal quantities of Portland cement and clean sand. The cement is made extremely fine by the grinding with the sand and the latter is also made very fine. The effect on mortar or concrete of this extreme fineness is to make it more dense, the fine material being increased in volume.

THE use of guides to keep a belt on a pulley is a poor makeshift. The edges of the belt invariably wear against the guides. The belt will run to the largest diameter of the pulley. This is the crown in the center and if the belt is so laced as to be under uniform tension and the shafting of two pulleys parallel, the belt should run true to the centers of both pulleys.

THE average cost of the copper produced in the United States during the last year is very close to 8 cents a pound, as against an average selling price of 16½ cents. The average of the cost at 8 cents has no significance except as a measure for the aggregate of the

profits. The range of the actual costs of production has been from 3 cents to 17. It is a question as to what is the cost per pound of copper where its production is from an ore that pays a profit from gold yield alone, making the copper, considered as a by-product, costless, except for melting, transportation and selling charges.

THE Supreme Court of Iowa has sustained the validity of an oral grant of mining privileges under which an entry was made and much labor and money expended, holding that the grantees acquired an interest in the land which was transferable, and did not acquire simply a license which was revocable or terminated at the death of the grantor.

IN building what is known as the Benton cut on the Great Northern R. R. in Montana, a steam shovel excavator with 1½-cubic-yard dipper was employed. With trains of nine or ten cars each of 1½-cubic-yard capacity the time required to load a train and put the first car of the succeeding trains in place was two minutes. In each ten-hour shift 800 to 900 cars were dumped.

THE United States mining law relating to the year for assessment work has not been changed. It still begins January 1st. The idea that it had been changed has probably had its origin in the report of the Senate Committee on Mines to the Senate, which recommended the change to October 1st. The Senate has taken no action on the report, and after it has the other branch of Congress must act on it.

THE Commissioner of the U. S. Land Office has ruled that hydrocarbon claims—for example, asphaltum, bitumen and gilsonite—must be located as lode claims, not as placers. The ruling was made in a contest between a senior placer location of a gilsonite deposit in Rio Blanco Co., Colo., and a junior lode location of the same ground. The ground of the ruling was that gilsonite was found in fissures and was logically a lode deposit.

THE fineness of the Mexican silver dollar is 900 by the coinage law. On remelting it is found to run from 899 to 900. The Mexican silver dollar is slightly heavier than the United States dollar, \$1000 Mexican weighing 15.63 ounces more than 1000 United States silver dollars. The face value is the same, but the Mexican dollar does not go by its face in the United States, but by its bullion value, which is fixed largely by the demand and supply market in Chinese exchanges.

THERE is considerable difference in the hardness of the ore in the Lake Superior region copper mines. At the Atlantic mine it is not much harder than indurated clay. At the Isle Royal mine it is an extremely hard flinty epidote. This difference makes a great difference in the cost of mining and milling and explains the profit that is made at the former mine from a production of thirteen pounds of copper a ton, where fifteen pounds to the ton in Isle Royal ore cannot pay costs.

IT has been found that stearic acid applied to and absorbed by the inner surfaces of a porous mould—plaster of Paris or baked moulding sand—will increase the fluidity of soft metal poured into the mould so that sound, homogenous castings can be made where the metal form cast is of very thin metal. With the ordinary mould, untreated with the stearic acid, the pouring of the soft metal, to make thin castings, has been impracticable, the poured metal not holding its fluidity sufficiently long to fill the mould. The new process has been patented.

HIGHLY refined formulas for the flow of water in pipes are not practically of much utility. The formulas are prepared from experiments on pipes that for convenience may be termed standard as regards clean, smooth interior surfaces, joints and bends. In practice no pipe line is standard in being an exact multiple of the pipe from which tests of flow have made formulas. Nor is there any knowledge that will tell the exact ratio of efficiency to the standard pipe. Approximate formulas with an allowance on the safety side can be used and will give safe estimates for construction.

WHERE there is even a comparatively small stream of water flowing naturally out of a tunnel or being pumped out of a shaft, the opportunities for its utilization to develop power should not be overlooked. It is frequently the case that the water pumped out of a mine shaft can be used to develop the power required to do the pumping. It can be safely estimated that for each eleven gallons of water flow per minute, with each 100 feet of fall available out of the mine, .25 H. P. can be obtained. Expressed in another form, each 100 feet of head or fall or the water outside of the mine, can be estimated on for the power necessary to lift an equal amount of water between 50 and 60 feet in the mine shaft.

WHERE within the boundaries of a placer claim there is a known lode, it is advisable to locate it and patent it with the placer claim, even should it not be known to be profitably metal bearing. The cost of obtaining the patent to it without contest is a less sum than the expense of a lawsuit over the title to it. It may later be discovered to have a value as a lode mine through the finding of a rich ore body, or a decrease in working costs or rise in sale price of the metal. The patenting of the lode is insurance against possible litigation. In patenting the lode, 25 feet width on each side gives sufficient area to protect it. Lode areas have to be paid for at the rate of \$5 an acre, while placer areas only cost \$2.50 an acre when bought for patent.

THE choice of drift mining or dredging a flat-lying gold-bearing deposit depends on a careful estimating of costs and conditions. It is assumed that the gold is all in the

bedrock, or in the bedrock stratum of gravel, and that the boundaries of the lead are known from preliminary driller prospecting, and that the same drill prospecting has made possible a proximate estimate of the gold values. The comparison is then between costs in which the magnitude of the deposit is an element. With a small deposit, drifting would probably figure out the least costly, as the capital investment is very much less. With deep ground and hard bedrock, drifting would probably be the safest. With shallow ground, soft bedrock and a large area of ground, the dredger will be almost certain to figure out the least costly. The mechanical appliances, as a rule, are more to be depended on for uniformity of cost throughout a placer mining exploitation.

THE slag piles of old lead smelters have been sources of profit for reworking. The ground the old smelters were built on has been profitably mined and in some exceptional instances mined a second time with profit. The brick and rock materials of old smelting furnaces have been known to pay well for treatment. So far there has been little attempt to treat the slags from old copper smelting furnaces where they were thrown away without being used over, and the possibilities of treatment of copper ore concentration tails have not attracted much attention. It would seem as if there is an opportunity for the chemist and metallurgist here. The older concentration plants did what would now be considered poor work, and some ores now treated do not concentrate close. One to two per cent of copper in tailings means twenty to forty pounds of copper to the ton in material that is already mined. There would seem to be possible a margin of profit to repay treatment by some of the leaching processes.

A CO-OWNER in a mining location can be divested of his interest in the claim or claims by the other co-owners if he refuse to contribute his proportion of the \$100 assessment work which the other co-owners do contribute. The statute of the United States defining the procedure to be followed should be adhered to strictly. It is doubtful if a demand for the proportion of an amount exceeding \$100 expended on a group of locations could be legally made. Under such conditions the demand of the defaulting co-owner for payment of his proportion of expenditure for assessment work on a group must be made for each one of the separate locations, and separate proceedings must be taken with each location. The defaulting co-owner in a group has the right of election of retaining his interest in some of the locations by paying up, and of relinquishing his ownership in other of the locations by defaulting. At the least, there would be the chance for a lawsuit if the proceedings were taken with the locations as a group.

WHERE two parallel lode claims made by the same claimant are located so that the common side line bisects as near as may be the center of the apex of the lode, it would seem that the senior of the two locations in point of time of location would take the lode wherever any of its apex was inside to it of the common line. If the entire width of apex in meandering went outside to it of the common boundary that portion would belong to the junior location. A court of equity in passing on such a case coming before it would seem likely to rule as above and might declare the junior location void. This last would seem inevitable if on the hearing it appeared that the lode on the common boundary line was the "discovery" on which both locations were based. The senior location, which in law would be the discovery location, could not be restricted to less than 25 feet of width on each side of the lode line if there is public land to that extent open to location. The court would possibly take the position that the senior location is legally entitled to 25 feet of the width of the junior as of the date of location of the senior claim where both are made by the same person with knowledge. This would show the junior location to be void. It would seem also that if the locator sold either of the claims a court of equity would hold that the buyer bought the whole of the lode, on the ground that it was the real thing that there was to sell.

THE work done by compressed air results in the using up of its heat units—that is to say, the air is colder at the end of an expansion than at the beginning. There is no difference in the quantity of work between expanding a given quantity of the air from 185 pounds gauge pressure down to 100 pounds gauge pressure and expanding the same quantity from 100 pounds pressure down to fifteen pounds, or the atmosphere. In either case exactly the same number of heat units that were in the air in the beginning must be used up. The higher the gauge pressure of the compressed air the larger the number of heat units it must lose in expanding to the atmospheric pressure. Practically these heat units are given to the compressed air by reheating before expanding. There is a mechanical limitation to reheating which makes the use of compressed air at very high pressure uneconomical. Liquid air represents the extreme of compression and the extreme conditions of uneconomical use. In experimental work no note has been taken of heat taken from the atmosphere during the expansion from liquid form down to working pressure, and claims of efficiency have been made which close analysis do not confirm. On large-scale commercial work the laboratory conditions cannot be maintained. The use of a compressed air plant exhausting back on itself, instead of the atmosphere, can not give any higher efficiency to the prime mover power, fuel or water, than exhaustion after work into the atmosphere.

Sampling Mill Work.

Written for the MINING AND SCIENTIFIC PRESS by JESSE SCOBEY.

When starting a new mill the aim is to make it a paying proposition at the earliest possible moment, and the resources of the head of the enterprise are wholly absorbed in keeping the mill going and in making what necessary mechanical improvements the circumstances of the case have developed and the treasury of the concern will allow. It is quite sufficient that the returns are in excess of expenditures, and it is only with the advent of competition that it is necessary to make a saving in the finest details of the method. Fortunately for the operator in gold milling, competition is restricted to individual merits. The character of the ore deposit is a factor, however, introduced into the milling of ores that compensates for the sharpening irritation of competition. Only a very few properties are in full values for a long life. The character and values change to make the deposit of lower grade or more refractory, and this is the mill man's perpetual spur to closer work. Older men, who are pioneers in milling, found it more expeditious to change their base of operations rather than their methods; finally the method claimed the man. The tendency of the mind is to perpetuate certain ideas. Political sentiments are mainly inherited, and modes of thinking require long periods of time to change. To the man who has expended the energy of a lifetime with the hammer and wrench as his sole aid in perfecting his enterprise it is hard to realize that a more technical method is superseding the old. The comparison of a close system of records heightens the observation and sharpens the interest in small details whose importance is only discovered by close and accurate work. Facts are developed that before escaped the observation and reasons for coincidences are sought for.

With the inauguration of business methods into mining, operators are not now content to simply accept the dividends of the mill manager, but it is required that he furnish data showing the cost of his work, the saving made, the time lost, and other details that go to make up the record of good or poor milling. The cause of poor milling may be inherent in the ore, and only from such detailed records can the scapegoat charge of "bad management" be sustained or disproved. Accurate records are often the salvation of many an earnest manager, and they should be as much insisted upon by him as by the directors.

By far the most prevalent system with small operators, where system at all is used, is to keep a record of the number of cars going to the mill per day, and to infer that each car will weigh, or that they will all average, a predetermined number of pounds, obtained by weighing some single car that was supposed to be an average, and to take a "grab" or hand sample from each ingoing car as it passes. From figures thus obtained the values going into the mill are supposedly obtained. From the smelter returns, giving the weight and value of the concentrates, the values recovered are eventually secured and the record of a month's run may be compiled, provided the concentrates happen to come out in even carload lots for the month. The comparison of the one to the other is published as the saving the mill is making. The same, however, is absolutely without meaning, for, while the values recovered are true, the weight of ore milled is to be seriously objected to; the weight of an occasional car may or may not be an average of the whole. We may logically deduce that the percentage saved arrived at may or may not be right. If we had omitted entirely to take any weights, a conservative figure might arbitrarily be selected to represent the weight of the whole, and might or might not be right. Figures and records mean absolutely nothing unless punctiliously and accurately kept. The so-called sample above obtained is to be bucked down by hand, and an absurdly small quantity is always selected, as personal endurance will not contemplate several tons and permit a sane man to undertake the work. Yet to sample ore, even as large as nut size, direct from the chutes will require a bulky mass of from five to ten tons to keep the probable error of the sample within the limit established by the assay. The system is, however, an aid to guessing, and should be so accepted. No results from such work should be in any way allowed to sway the judgment.

A step in advance is the establishment of track scales, whereby the actual weight of the ore is correctly determined; but as the strength of the chain is determined by its weakest link, so is the result of this work still weak, and, therefore, useless until positive and automatic sampling in quantities depending upon the size of the ore particles sampled is installed. With a proper device the ore may be sampled after it has been completely reduced and is in transit to the machine on which it is to be treated.

Mills are now common in which ore scales and samplers are keeping an accurate record of the incoming ore, and in such mills the weight of the concentrates may be determined daily by small platform scales, or

be obtained for the month by taking the railroad weight of carload lots. The weight must be known in order to arrive at the extraction made, as the formula used is:

$$\text{Extraction in \%} = \frac{\text{Weight of concentrates} \times \text{assay value}}{\text{Weight of ore} \times \text{assay value}} \quad (1)$$

As the weight of the ore and the assay value are known for each day's run, it should be considered economy to also weigh the daily output of concentrates and thus obtain a daily record of the work the mill is doing. If the ore is changing, it is well to watch the mill; if the ore is constant, it is good discipline to keep a record of the men.

These daily records can be more simply obtained by figuring from the assay value of the mill tailings, as, with this data, which is in itself most valuable, three different methods may be used, the last of which is to be especially recommended from its extreme simplicity.

In the first the weight of the ore, the weight of the concentrates, the assay of the tailings and the assay of the concentrates are alone needed, and the extraction is figured as follows:

$$\text{Extraction in \%} = 100 - \frac{(m - e) \times \text{assay tailings}}{(e \times \text{assay conc.}) + (m - e) \times \text{assay tailings}} \quad (2)$$

Where m = the weight of ore and e = the weight of concentrates. In this instance the assay of the crude ore is not needed and the formula may be useful where apparatus for sampling the crude ore is not at hand or is inconvenient to install, or where hand sampling has been in vogue and should be discontinued from its inaccuracy.

In the second the weight of ore, the weight of concentrates, the assay of ore and the assay of tailings are needed, and the formula is simply:

$$\text{Extraction in \%} = 100 - \frac{(m - e) \times \text{assay tailings}}{m \times \text{assay ore}} \quad (3)$$

In these equations the factor of weight is the most expensive to obtain and is especially troublesome where any storage capacity is at the head of the mill and after the ore scales. This, of course, is a permanent arrangement, as the ore must be delivered to the mill machines in a regular feed, and the ore bin and automatic feeder are essential to displace the intermittent supply furnished by the mine. In attempting to figure the day's run an approximation must be made of the ore remaining in the bins, and while the summation for the month is correct the separate items are inaccurate.

The third method is to be used in a completely modern plant now being built in Denver from plans of the writer. No arrangement is made for weighing either the incoming ore or outgoing concentrates, as in the case at hand a record of both will be kept in carload lots. The feature is that a daily or shift record of the percentage saved of extraction made is to be accurately recorded with only the assay of the ore, concentrates and tailings entering into the calculation. The equation is:

$$\text{Extraction in \%} = \frac{c \times (a - b)}{a \times (c - b)} \text{ in which } a = \text{the assay of the crude ore, } b = \text{assay of the tailings and } c = \text{assay of the concentrates.}$$

This is a very simple equation, and is very simply deduced, yet we have not known of any like or similar equation, and beg to submit a personal effort, hoping it may be found useful. It is arrived at in this manner, allowing:

$$\begin{aligned} m &= \text{tons of ore milled; } a = \text{assay of ore.} \\ e &= \text{tons of concentrates produced; } c = \text{assay of concentrates.} \\ (m - e) &= \text{tons of tailings; } b = \text{assay of tailings.} \\ a \times m &= (e \times c) + (m - e) \times b, \text{ therefore } a m = e c + m b - e b, \therefore a m - e b = e c - e b, \text{ therefore } m(a - b) = e(c - b). \end{aligned}$$

$$m = \frac{e(c - b)}{(a - b)} \quad (4)$$

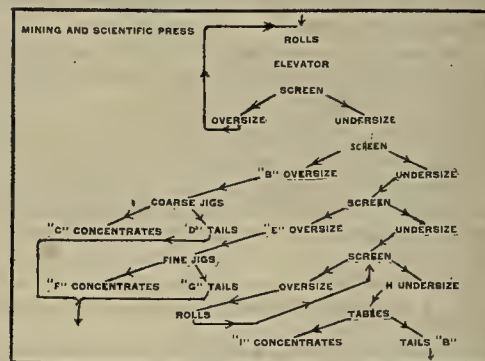

$$\begin{aligned} \text{From equation (1) extraction \%} &= \frac{(e \times c)}{(m \times a)} = \\ &= \frac{ec}{a \frac{e(c - b)}{(a - b)}} = \frac{ec(a - b)}{ae(c - b)} \end{aligned}$$

$$\text{Therefore, extraction in \%} = \frac{c(a - b)}{a(c - b)} \quad (5)$$

In this last equation the weights have been eliminated and only three assay values remain to solve the problem. A Scobey automatic tailings sampler is to take the sample of the crude ore after it has been reduced to its treatment size, i. e., 30 mesh and in suspension in water. A second sampler is to take a like sample of the tailings. The concentrates will be sampled by quartering the accumulation of every fifth shovelful that is thrown into the storage bin.

It will be noticed that equation No. 4 gives the weight or tonnage in terms of the assay values.

When correct sampling is in vogue this equation may be put to useful services, as in the following very standard mill arrangement, in which ten daily samples properly taken may answer all possible questions that may at any time be made.

The ore going to the mill may be determined by

$$m = \frac{\text{weight "C" (assay "C" - assay "B")}}{(\text{assay "A" - assay "B"})} \quad (6)$$

The pulp going to the coarse jigs is known by changing the values and solving for

$$m = \frac{\text{weight c (assay c - assay d)}}{(\text{assay b - assay d})} \quad (7)$$

The pulp going to the fine jig

$$m = \frac{\text{weight f (assay f - assay g)}}{(\text{assay e - assay g})} \quad (8)$$

The pulp going to the tables

$$m = \frac{\text{weight i (assay i - assay "B")}}{(\text{assay h - assay "B"})} \quad (9)$$

The effect of different mesh trommel covering on the jigs may be accurately studied, primarily, in balancing the feed to the two jigs by comparing the equations (7) and (8); secondly, by watching the saving made by each one by comparing the extraction of each, as may be determined in the following equations:

The extraction for the mill, complete, would be

$$\text{Ext.} = \frac{"C" ("A" - B)}{A ("C" - B)} \quad (10)$$

The extraction on the coarse jig

$$\text{Ext.} = \frac{c(b - d)}{b(c - d)} \quad (11)$$

The extraction on the fine jig

$$\text{Ext.} = \frac{f(e - g)}{e(c - g)} \quad (12)$$

The extraction on table

$$\text{Ext.} = \frac{i(h - "B")}{h(i - B)} \quad (13)$$

While it is recognized that in records of this kind there will oftentimes be erratic conclusions resulting from mistakes that are sure to happen in both preparing the sample and assaying, these may be thrown out and the summation for any considerable time will develop the facts. Further, by applying the results of the assay in this manner, especially in deducing the tonnage going to the jigs, the work of assaying is constantly under check, as the sums of the tonnage going to the jigs must be less than the total tonnage of the mill by the amount of undersize going directly to the tables. Errors are thus shown up that might otherwise go unquestioned.

The quantity representing the assay value in the above formulas may be used to represent either a single metal or all the metals, and the saving on any single metal, or on all the metals, may be independently determined.

When the men understand that these things are being watched there will undoubtedly be less carelessness in the work, as any loss is sure to be immediately located, and if the records are kept for the separate work of the jigs and tables the men in charge of these machines may be held personally responsible for the bad work. When it is possible to assay the necessary number of samples per day, these samples may be taken at the end of each shift, and the work of the different foremen compared.

We are fully aware that this system is quite in advance of the present general practice, but the point is urged that science in all its branches is but the compiling of accurate facts resulting from minute measurements in both weights and measures.

High scientific attainment is only the use of the most delicate measuring instruments. Balances of the most delicate accuracy are now common in every mining camp, and it only remains to apply accurate sampling devices to enable ore milling to be placed on a thoroughly scientific basis.

A Plea for Greater Simplicity in the Language of Science.*

NUMBER II.—CONCLUDED.

By T. A. RICKARD.

Science has been well defined as "organized common sense." Let us, then, express its findings in something better than a mere jargon of speech and avoid that stupidity which Samuel Johnson—himself an arch sinner in this respect—has fitly described as "the immense pomposity of sesquipedalian verbiage." George Meredith, a great mint-master of words, has recorded his objection to "conversing in tokens not standard coin." Indeed, the clumsy latinity of much of our scientific talk is an inheritance from the schoolmen of the past; it is the degraded currency of a period when the vagaries of astrology and alchemy found favor among intelligent men.

Vagueness of language produces looseness of knowledge in the teacher as well as the pupil. Huxley, in referring to the use of such comprehensive terms as "development" and "evolution," remarked that words like these were mere "noise and smoke," the important thing being to have a clear conception of the idea signified by the name. Examples of this form of error are easy to find. The word "dynamic" has a distinct meaning in physics, but is ordinarily employed in the loosest possible manner in geological literature. Thus, the origin of a perplexing ore deposit was recently imputed to the effects produced by the "dynamic power" which had shattered a certain mountain. "Dynamic" is of Greek derivation and means powerful; therefore, a powerful power has done this thing; but in physics the word is used in the sense of active, as opposed to "static" or stationary, and it implies motion resulting from the application of force. In the case quoted, and in many similar instances, the word "agency" or "activity" would serve to interpret the hazy idea of the writer, and there is every reason to infer, from the context, that he substituted the term "dynamic power" merely as a frippery of speech. It is much easier to talk grandiloquently about a "dynamic power" which perpetrates unutterable things and reconstructs creation in the twinkling of an eye than it is to make a careful study of a region, trace its structural lines and decipher the relations of a complicated series of faults. When this has been done and a writer uses comprehensive words to summarize activities which he has expressly defined and described, then, indeed, he has given a meaning to such words which warrants him in the use of them.

In this connection it is amusing to remember how Ruskin attacked Tyndall for a similar indiscretion. The latter had referred to a certain theory which was in debate, and he had said that it, and the like of it, was "a dynamic power which operates against intellectual stagnation." Ruskin commented thus: "How a dynamic power differs from an undynamic one—and, presumably, also, a potestatic dynamic from an unpotestatic one—and how much more scientific it is to say, instead of that 'our spoon stirs our porridge,' that it 'operates against the stagnation of our porridge,' Prof. Tyndall trusts the reader to recognize with admiration."

Among geological names there is that comfortable word "metasomatosis" and its offspring of "metasomatic interchange," "metasomatic action," "metasomatic origin," etc. To a few who employ the term to express a particular manner in which rocks undergo change, it is a convenient word for a definite idea; but for the greater number of writers on geological subjects it is a wordy cloud, a nebular phrase, which politely covers the haziness of their knowledge concerning a certain phenomenon. When you do not know what a thing is, call it a "phenomenon." Instances of mere vulgarity of scientific language are too numerous to mention. "Auriferous" and "argentiferous" are ugly words. They are unnecessary ones, also. The other day a metallurgical specialist spoke of "auriferous amalgamation," as though any process in which mercury is used could be gold bearing, unless it was a part of the programme that somebody should add particles of gold to the ore under treatment. A mining engineer, of the kind known to the press as an expert, described a famous lode as traversing, "on the one hand, a feldspathic tufaceous rock," and "on the other hand, a metamorphic matrix of a somewhat argillaceous composition." This is scientific nonsense, the mere travesty of language. To those who care to dissect the terms used, it is easily seen that the writer of them could make nothing out of the rocks he had examined save the fact that they were decomposed, and that the rock which he described last might have been almost anything, for all he said of it; for his description, when translated, means literally a changed matter of a somewhat clayey-sandy composition, which, in Anglo-Saxon, is m-u-d-l. The "somewhat" is the one useful word in the sentence. Such language may be described in the terms of mineralogy as metamorphosed English pseudomorph after blatherskite.

Some years ago, when I was at a small mine near Georgetown, in Colorado, a professor visited the underground workings and was taken through them. He immediately began to make a display of verbal fireworks, which bewildered the foreman and the other miners whom he met in the mine—all, save one, a little Cornishman, who, bringing him a bit of the clay which accompanied one of the walls of the lode, said to him:

"What do 'ee call un, you?"

The professor replied:

"It is the argillaceous remnant of an antediluvian world."

Quick as a flash came the comment:

"That's just what I told me pardner." He was not deceived by the vapor of words.

Next consider the position of the reader. It is scarcely necessary at this date to plead for the cause of technical education and the generous bestowal of the very best that there is of scientific knowledge. The great philosophers of that new reformation which marked the era of the publication of "The Origin of Species," have given most freely to all men of their wealth of learning and research. When these have given so much, we might well be less niggardly with our small change and cease the practice of distributing, not good, wholesome, intellectual bread, but the mere stones of knowledge, the hard fossils of what were once stimulating thoughts. In the ancient world the Eleusinian mysteries were withheld from the crowd and knowledge was the possession of a few. Do the latter day priests of science desire to imitate the attendants of the old Greek temples and confine their secrets to a few of the elect by the use of a formalism which is the mere abracadabra of speech? Among certain scientific men there is a feeling that scientists should address themselves only to fellow scientists, and that to become an expositor to the unlearned is to lose caste among the learned.

It is the survival of the narrow spirit of the dark ages, before modern science was born. There are not many, however, who dare to confess to such a creed, although their actions may occasionally endorse it. On the whole, modern science is nothing if not catholic in its generosity. "To promote the increase of natural knowledge and to forward the application of scientific methods of investigation to all the problems of life" was the avowed purpose of the greatest of the philosophers of the Victorian era.

There are those who are full of a similar good will, but they fail in giving effect to it because they are unable to use language which can be understood. In its very infancy geology was nearly choked with big words, for Lyell, the father of modern geology, said, seventy years ago, that the study of it was "very easy, when put into plainer language than scientific writers choose often unnecessarily to employ." At this day even the publications of the geological surveys of the United States and the Australian colonies, for example, are occasionally restricted in usefulness by erring in this respect, and as I yield to none in my appreciation of the splendid service done to geology and to mining by these surveys, I trust my criticism will be accepted in the thoroughly friendly spirit with which it is offered. It seems to me that one might almost say that certain of these extremely valuable publications are "badly" prepared because they seem to overlook the fact that they are, of course, intended to aid the mining community in the first place and the public, whether lay or scientific, only secondarily. From a wide experience among those engaged in mining, I can testify that a large part of the literature thus prepared is useless to them, and that no one regrets it more deeply than they, because there is a marked tendency among this class of workers to appreciate the assistance which science can give. Take, for example, a sentence like the following, extracted from one of the recent reports of the U. S. Geological Survey: "The ore forms a series of imbricating lenses, or a stringer lead, in the slates, the quartz conforming, as a rule, to the carunculated schistose structures, touches occasionally breaking across laminae, and sometimes the slate is so broken as to form a reticulated deposit." This was written by one of our foremost geologists, and, when translated, the sentence was found to convey a useful fact; but is it likely to be clear to anyone but a traveling dictionary? A thoroughly literary man might know the exact meaning of the two or three very unusual words which are employed in this statement; but the question is: Will it be of any use whatever even to a fairly educated miner, or be understood by those who pay for the preparation of such literature, namely, the taxpayers? An example of another kind is afforded by a Tasmanian geologist who recently described certain ores as due to "the effects of a reduction in temperature of the hitherto liquefied hydroplutonic solutions, and their consequent regular precipitation." These solutions, it is further stated, presumably for the guidance of those who wield the pick, "ascended in the form of metallic superheated vapors which combined eventually with ebullient steam to form other aqueous solutions causing geyserlike discharges at the surface, aided by subterranean and irrepressible pressure." At the same time certain "dynamical forces" were very busy indeed and "eventuated in the opening of fissures"—of which one can only regret that they did not swallow up the

author as Nathan and Abiram were once engulfed in the sight of all Israel.

It will be well to contrast these two examples of exuberant verbosity, because the first befalls the statement of a scientific observation of value, made by an able man, while the second cloaks the ignorance of a charlatan, who masquerades his nonsense in the trappings of wisdom. Here you have an illustration of the harmfulness of this kind of language, which obscures truth and falseness alike, to the degradation of science and the total confusion of those of the unlearned who are searching after information.

Let the writer on scientific matters learn the derivation of the words he uses and then translate them literally into English before he uses them, and thereby avoid the unconscious talking of nonsense. If he knows not the exact meaning of the terms which offer themselves to his pen, let him avoid them and trust to the honest aid of his own language. "Great part of the supposed scientific knowledge of the day is simply bad English, and vanishes the moment you translate it," says Ruskin. The examples already given illustrate this. "Every Englishman has, in his native tongue, an almost perfect instrument of literary expression," so says Huxley, and he illustrated his own saying. Huxley and Ruskin were wide apart in many things, and yet they agreed in this. Ruskin proved abundantly that the language of Shakespeare and the Bible can be used as a weapon of expression keen as a Damascus sabre when it is freed from the rust of classic importations, which make it clumsy as a crowbar.

There is yet another reason against the excessive use of Greek-English words, in particular. Greece is not a remnant of extinct geography, but an existing land with a very active people and a living language. The terms which palæontology has borrowed from the Greek may be returned by the Greeks to us. And, as Ruskin points out, "What you, in compliment to Greece, call a 'Dinotherium,' Greece, in compliment to you, must call a 'Nasty-beastium,' and you know the interchange of compliments can't last long."

In all seriousness, however, is it too much to ask that all such technical terms as are considered essential shall not be used carelessly, and that in publications intended for an untechnical public, as are most Government reports, an effort be made to avoid them, and, where unavoidable, those which are most likely to be understood shall be translated in footnotes? Even as regards the transactions of scientific societies, I believe that those of us who are active members have little to lose and much to gain by confining the use of our clumsy terminology to cover ideas which we cannot otherwise express. By doing so we shall contribute, I earnestly believe, to the advancement of science, which we all have at heart.

The words which, at first, are the exclusive privilege of the specialist, gradually extend into wide use, following in the wake of that diffusion of scientific knowledge which is one of the objects of this Association. We believe that to get alongside of facts to apply the best knowledge available, to seek the truth for its own sake, it is as essential to the well being of the individual life as it is to the success of a machine shop, and as beneficial to the community as is a smelting works.

In furtherance of this principle we must remember that language in relation to ideas is a solvent, the purity and clearness of which affect that which it bears in solution. Whewell, in "The Philosophy of the Inductive Sciences," has expressed this view of the matter with noble eloquence. "Language," he said, "is often called an instrument of thought; but it is also the nutriment of thought, or, rather, it is the atmosphere in which thought lives; a medium essential to the activity of our speculative powers, although invisible and imperceptible in its operation; and an element modifying, by its qualities and changes, the growth and completion of the faculties which it feeds."

In considering this subject from this standpoint, there is borne in upon the mind a suggestion which carries our thought far beyond the confines of the matter under discussion. Such power of speech as man possesses is a faculty which appears to divide him from all other living things, while at the same time the imperfection of it weighs him down continually with the sense of an essential frailty. To be able to express oneself perfectly would be divine, to be unable to make oneself understood is human. In "Man's Place in Nature," Huxley points out that the endowment of intelligible speech separates man from the brutes which are most like him, namely, the anthropoid apes, whom he otherwise resembles closely in substance and in structure. This endowment enables him to transmit the experience which in other animals is lost with each individual life; it has enabled him to organize his knowledge and to hand it down to his descendants, first by word of mouth and then by written words. If the experience thus recorded were properly utilized, instead of being largely disregarded, then man's advancement in knowledge and conduct would enable him to emphasize, much more than is permitted him at present, his superiority over the dumb brutes. Considered from this standpoint, language is a factor in the evolution of the race and an instrument which works for ethical progress. It is a gift most truly divine, which should be cherished as the ladder which has permitted of an

* Read before the American Association for the Advancement of Science, Denver meeting, Aug. 27, 1901.

ascent from the most humble beginnings, and leads to the heights of a loftier destiny, when man, ceasing to stammer forth in accents which are but the halting expression of swift thought, shall photograph his mind in the fullness of speech, and, neither withholding what he wants to say nor saying what he wants to withhold, shall be linked to his fellow by the completeness of a perfect communion of ideas.

Galvanizing and Recovering Galvanizing Wastes.*

The trade term "galvanizing" relates to the coating of iron with zinc. In order to do this the iron article to be coated must first be surface cleaned from all dirt and other impurities, so as to present a perfectly clean metallic surface. If any dirt, scale or oxide remains on the surface the zinc will not adhere to that part, and imperfect work will be the result. This cleaning is done by immersing the article in a bath of sulphuric acid and water, well washing in water, plunging in hydrochloric acid for a short time and drying. The article is then put into the bath of molten zinc. If sheets, or similar articles that will not hold much water, are being coated, the drying may be dispensed with to advantage. The galvanizing tank, or bath, as it is called, is of necessary size for the articles to be submerged, varying from one-half ton to thirty tons capacity.

This tank is usually oblong in shape and is divided on its surface, by a longitudinal partition, into two parts. On one side of the division ammonium chloride is placed, which will dissolve the oxide of zinc on the surface or prevent its formation. The other side of the bath is kept clean by continually skimming off the oxide of zinc as fast as it forms. In this skimming of the pot considerable shot metal is unavoidably removed with the oxide. The side with the sal ammoniac soon becomes covered with a thick black scum, which consists of the dissolved oxide, which has partly decomposed the ammonium chloride and formed a double chloride of zinc and ammonium.

The sal ammoniac must be fed continually to the top of the pot so as to keep the surface of the molten zinc clean and free from oxide, or else the oxide will adhere to the iron surface and affect injuriously the finished product by leaving spots uncoated with zinc.

By the continued addition of sal ammoniac the scum accumulates on the top of the pot and soon gets too thick for the workman to push his plates or other articles through, so a portion is removed from time to time. This yields on one side a waste called sal ammoniac skimmings and on the other side zinc oxide or zinc skimmings.

Yet another by-product is made that is called zinc slab dross. This is formed by the continued washing away of a portion of the iron that is being galvanized, for zinc in a molten state will alloy with iron, so that as soon as the iron becomes as hot as the bath its surface begins to dissolve in the zinc. If from accident or design a piece of iron is left in the bath after this dissolving process commences, it will in time be entirely dissolved. We often find bolts, nails, castings, etc., from the bottom of the bath that are nearly all, as it were, eaten away or dissolved in the zinc.

This addition of iron to the bath forms an alloy of iron and zinc that is of greater specific gravity than the zinc itself, and which falls to the bottom of the bath. If the bath is run hot it collects very fast, but under ordinary circumstances a bath of the usual size for pipes or sheets will make a ton of this dross in a week.

In order to have depth enough to do the work properly, the dross must be removed. This is usually done every Saturday afternoon. A large spoon is used, perforated with holes to allow the zinc to drain out, and the semi-fluid dross is pasted into moulds, smoothed off with a shovel, and is then the slab dross of commerce.

Thus it appears that we have three by-products: Sal ammoniac skimmings from one side, zinc oxide or zinc skimmings from the other, and slab dross from the bottom of the bath.

SAL AMMONIAC SKIMMINGS.—In 1871 there was no use for the sal ammoniac skimmings and it was thrown away. I found by leaching these skimmings with hot water and steam that I got all the zinc chloride and ammonium chloride in solution. This I evaporated down and recrystallized for use again on the bath. The residue, after washing with water and drying, I found to contain zinc oxide, with some little dirt and shots of metallic zinc. I placed this in a tumbler, or octagon-shaped barrel, with the joints not very tight. After revolving for some time all the lumps were ground to powder and the metallic particles were clean and ready for melting on the top of a pot of molten zinc. The oxide, in the shape

it was in, was worth \$30 per ton to the makers of zinc white paint. The average yield was:

| | Per cent. |
|---------------------------------|-----------|
| Zinc..... | 20 |
| Ammonium and zinc chloride..... | 30 |
| Zinc oxide..... | 35 |
| Iron scale and dirt..... | 15 |

ZINC OXIDE SKIMMINGS.—This, as previously mentioned, consists of zinc oxide and shot metal. All that was needed was to place it in the tumbler or barrel before described and then melt the resulting shot metal, pouring into suitable ingots.

ZINC DROSS.—The third and most important residue is zinc dross, or zinc contaminated with iron. At the time I began working in this line the greater part of the slab zinc dross was sent to England. The then only known way of using it to advantage was to distil it in retorts just as zinc is originally made from the ore. I built a retort furnace and made very good commercial zinc, but the process was very costly. I found that the distilling cost from \$30 to \$35 per ton.

After much experimenting to find a less costly method, I found that cyanides answered the purpose admirably, but the cost was prohibitory. Sulphur and superheated steam were both good. I built a plant to treat the dross on a large scale and made a very simple furnace to superheat the steam and a tube for feeding the pot with chemicals. This furnace was the same as those now in use, except that they are now built much larger. I wanted to treat the molten metal with superheated steam and also wanted to use the cyanide and the sulphur. Accordingly I devised a method which readily overcame all the difficulties of their application. We all know that potatoes are composed largely of water, and that leather scrap is used in making cyanide, so I used a mixture of sulphur, potatoes and leather scrap, and introduced the mixture into the bath by means of an injector. This could be held under the molten metal and soon became hot enough to generate steam, distil the sulphur, and throw off the gases from the leather. The pot distils all it wants, the steam keeps the pot boiling, and about fifteen minutes cooks the pot of molten metal. After the pot is boiled it is necessary to allow it to settle awhile, the oxides coming to the top and the new iron and zinc compounds going to the bottom. After it has properly settled the good metal is bailed into moulds and the residue is dug out with a shovel.

Mining in Mexico.*

An advantage that the miner enjoys in Mexico is the remarkable liberality of the laws relating to his occupation. He is regarded as an individual who deserves special encouragement, for his enterprise gives employment to hundreds of thousands and injures no one. One immense item is the fact that the entire area of Mexico is open to exploration, except within the limits of pueblos or towns and on territory used for governmental purposes. Ownership of the surface of land does not carry with it title to the mineral wealth below, and anyone who discovers a deposit of mineral has the absolute right to denounce or file on it and carry on his mining operations, no matter who holds the title deeds to the top of the ground. He can also denounce a hacienda, or mill site, and whatever more may be necessary to conduct his business to the best advantage. If he needs wood or water, no grasping landlord can extort an exorbitant price for these prime necessities. If the miner and the landlord cannot agree on terms, the former notifies the latter that he has appointed Senor — to represent him in fixing rates. In eight days the land owner must nominate a like representative. These two, with the local Judge of the First Instance (Superior Judge), form a board of arbitration, which must convene, consider the case and render a decision within eight days, fixing legally the prices that may be charged. An appeal lies from this decision, but in the meantime the miner can go ahead and take wood and water at the figures named by the arbitrators. As a matter of fact, these decisions are scarcely ever appealed from, nor is it even necessary often to have recourse to boards of arbitration. The miner's remedy being speedy and decisive, arrangements are usually made without serious friction on either side; and it may be said here that a little of this summary way of dealing out justice might be copied in the United States to the general advantage of litigants. In other words, the miner holds the top hand at all stages of the game. In California, after he finds a mine, as like as not it will be rendered valueless because some unconscionable fellow owns the only accessible water and timber and will not allow him to use of these essentials except on terms that are practically prohibitive. Again, exploration in California is practically limited to the public domain, constantly lessening in area; for it is small comfort to find a mine on another man's land and receive only his thanks for your trouble.

Then you have a very efficient, cheap and contented class of laborers to deal with. The Mexican miner is industrious to the backbone, is native born to his trade, for his forefathers have worked in the same

groove for generations, and he is perfectly satisfied with his lot. There are no unions, walking delegates or strikes or friction between employer and employee, providing the former treats his men half way decent. He must pay them promptly, have some regard for life and limb about his works, and not attempt to overreach them too outrageously in general matters of business. When these plain conditions are disregarded, there is trouble of the passive kind and lots of it. That is, when a mine once gets a bad name by reason of ill treatment of its employees, you might as well try to move the Sierra Madre as induce a Mexican to work in it. Valuable properties have been compelled to close their works and keep them closed through the folly of their management in dealing with their men. But accord them fair treatment and they are as easy a lot to get along with as I ever met.

Recovery of Tin From Tin Plate Clippings.

Written for the MINING AND SCIENTIFIC PRESS by
JAS. W. WORSEY.

Chlorine, like sulphuric acid, is of great importance to the metallurgist, and, like it, is produced in quantity and cheaply by the improved Le Blanc process. There is scarcely any metal or metalloids that chlorine will not attack and dissolve; but it works best when brought in contact with the substance to be treated in the nascent state. All the noble metals can be acted upon by it, and even extracted from their ores—no matter how refractory—and good and clean results obtained, provided proper conditions be arranged beforehand for the particular mineral. There are many forms from which nascent chlorine can be readily obtained, as sodium chloride, hydrochloric acid, bleaching powder, and the like, and from these the chemist can select the most suitable for his purpose.

About eleven years ago my attention was directed to the recovery of tin from tin clippings. These clippings were in almost unlimited supply, ingot tin was costly, and iron commanded good prices. There were several small factories treating this refuse in a very crude fashion. The precipitated metal only tested 50%, and the iron, if not sold and used up at once, corroded all away. These serious drawbacks were overcome by me and the Mersey Metal Co., Ltd., was formed to work the process that I devised. Our works commenced operating and the first tin precipitate we made assayed over 98% and realized in the market £96 per ton. The iron—freed from tin—realized 20 shillings per ton more than the scrap cost. The plant consisted of a large wooden dipping tank, into which were put some seven tons common hydrochloric acid. We had also a wooden crate worked by a winch, with which we dipped the clippings into the acid, heating the latter by means of superheated steam. The tin dissolved off readily in about fifteen minutes, for a fair number of charges, but after the acid had combined with a good quantity of tin the action of dissolving was considerably slower, till over two hours were required to do the work of the fifteen minutes at the beginning. This was considerably improved by adding a ten-gallon carboy of strong sulphuric acid, and in practice enabled us to work over eighteen tons of tin clippings, which was one full week's work. The acid was now fully saturated with tin and the recovery of the tin was done by placing old galvanized iron in any form in the solution in separate wooden tanks made for the purpose. After diluting the liquor with water the tin floated on the surface and was collected and well washed in a filter press, afterwards mixed with pine sawdust and melted in a reverberatory furnace. The product was fine tin. The iron was dipped into a water tank after draining and the iron was then tilted into trucks for the copper precipitators, who gave it the preference to any other light iron of like price in the market. The liquor was then freed from iron by bleaching powder and the zinc recovered by sodium hyposulphite, was of very good color and worth some £30 per ton.

Later I made improvements in the process, involving changes in the plant and in the use of the reagents. The large acid bath is not required, the wear and tear of the appliances are very considerably reduced, and the iron—after stripping—is not so liable to easily corrode away. The improved plant can be erected anywhere and at a very moderate cost, and the needful reagent made on the ground, if sulphur can be obtained. It is an industry that will pay well, even better than working a Cornish tin mine, if only plenty of scrap and cuttings can be easily obtained. One of the most important things is a proper tank in which the solution of the tin can be properly effected. I found a very useful one in the shape of an old egg end of a boiler about 6 feet diameter and 8 feet long, and this I lined inside with oak 1 inch thick, properly fitted and jointed so as to protect the sides of the vessel from the action of the chemicals used during the treatment. This apparatus is so constructed that it can be tilted and emptied. In this tank is arranged a steam spray at the bottom in such a way that the steam is equally

* J. H. Wilkins in Modern Mexico.

distributed. The cuttings, etc., to be freed from tin are placed inside this machine up to say about 1 foot from the top, and covered by a weak solution of sulphate of sodium, which is heated by the steam, all the time it is running in, up to 160° Fahr. About two pounds sodium nitrate is added, and then say about two gallons common sulphuric acid. When the whole is thoroughly mixed one quart of sulphur dichloride (S_2Cl_2) is added, so as to reach to the bottom with it. The steam is now turned off and the reaction allowed to proceed for some twenty minutes, when the clippings may be examined, and if they are nearly clean a little more time and a little more steam—up to boiling—may be given. Sometimes an extra pint of this S_2Cl_2 may be needed, but very much depends upon the cuttings, and also upon the operator. When finished the tin solution is run off by decanting and cold water sprayed over the iron scrap to wash off any tin solution remaining. When the iron is considered cleaned it is removed and sent to the puddling or other furnace for the manufacture of iron bars or sheets.

The washings are set aside for making up sulphate of soda solution, and the strong tin solution treated for the recovery of the tin and zinc, as above described. The average working of the plant showed over 2% tin on the clippings, and there should be no difficulty in turning out ingot tin 99% fine if this scheme be properly followed.

Mining and Metallurgical Patents.

Patents Issued September 9, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK AND ORE PULVERIZER.—No. 682,170; T. W. Capen, Chicago, Ill.

A frame portion, a vertical operating shaft provided with a crushing head, crushing ring concave mechanism surrounding crushing head between which elements material may be fed and ground, and lever mechanism for holding crushing ring concave mechanism in operative position and entirely removing and holding ring without the operative sphere of head.

PROCESS OF PRODUCING METALLIC OXIDES FROM COPPER ORES BY AMMONIUM SOLUTIONS.—No. 682,232; D. A. Beck, Goodsprings, Nev.

Production of metallic oxides from copper ores by ammonia solutions, process by decomposing a cupro-ammonia solution, by subjecting solution to simulta-

neous action of steam and hot air; collecting and condensing ammonia, and cooling steam and thereby condensing it after decomposing process and before ammonia is condensed.

DUMPING CAGE FOR MINES.—No. 682,525; B. Brantingham, Hocking, Iowa.

A tilting platform, centrally pivoted on cage, a shaft mounted in bearings on cage constituting pivotal bearing of platform, of guide rails having each an inclined portion at its upper end, a curved rail located above each inclined portion, an arm secured at one end to each end of shaft and intermediate, its ends being secured to platform, and a wheel mounted on opposite end of each arm, and located between guide rail and one shoe of cage and adapted to engage the under side of curved rail in upward movement of cage.

ORE SAMPLING MACHINE.—No. 682,528; A. C. Calkins, Los Angeles, Cal.

A frame D supported at one side and having a central vertical shaft s' , in combination with a bevel gear b' , with closed hub b^3 and pendant covering flange b^2 and a surmounting bucket having radial partitions and bottom, openings and a driving gear wheel housed and covered by flange b^2 .

COMBINED GOLD WASHER AND AMALGAMATOR FOR PLACER MINING.—No. 682,545; W. L. Harraman, F. O. Chapman, C. Severin and D. H. Brown, Grand Junction, Colo.

A longitudinally vibrating flume having an amalgamating bottom provided with mercury-holding pockets located at intervals along its length, flume having its sides converged at its delivery end, a series of transverse, closely juxtaposed, parallel slats constituting amalgam-catching riffles disposed between converged sides of flume, a screen carried by flume at upper or receiving end, above flume bottom, and adapted to receive material prior to enter-

ing flume, screen being inclined upwardly from its receiving to its opposite end, whereby material is retarded in its forward motion on screen, and an annular divider located at higher end of screen with its apex directed thereto, divider being adapted to divert coarse material laterally from screen and over sides of flume.

The Bromo-Cyanogen Process.

The application of the bromo-cyanogen process may be considered as technically divisible into (1) preliminary mechanical treatment of the ore preparatory to (2) second stage of the process, where the reagents are employed and the metal recovery made. The most complete published technical data of the actual operation of the process that is available for comparison is taken from the operation of the Deloro mine in Ontario, Canada. There the ore consists of quartz containing mispickel, some copper pyrite and frequently a large per cent of pyrite, and the treatment scheme provides for the recovery of both the gold and the arsenic. The following only deals with the handling of ore containing mispickel. The mine run ore is first hand sorted and the white quartz known to contain little or no value is returned to the mine for vein filling. The ore is crushed in a stamp mill with water through a No. 40 burr slot screen. Amalgamation is done in the battery and on outside plates, care being required here on account of the presence of the mispickel. The tail pulp from the plates passes to vanners. The vanner tails go to hydraulic classifiers and are run thence in coarse, medium and fine grades to three more vanners. The tails from the second set of vanners are found to carry only 2% to 2½% of the gold, and 0.5% of the mispickel of the ore, and are wasted. The concentrates are treated by the bromo-cyanide process. The plant used consists of four solution tanks on the floor above the leaching vats; three small steam pumps for pumping liquors; three sump tanks (forty-gallon barrels); two fifty-gallon barrels holding stock solution of cyanogen bromide; one Sulman's cone for the use of zinc fume for precipitation; one settling box connected with cone; one zinc box for running drainings of vat charges through. The pipe and clean-up plant are the same, with minor detail modifications, as usual with cyanide treatment plants. The wet concentrates as received from the mill consist principally of mispickel, some pyrite with small quantities of copper and 15% to 20% of silica-quartz sands—which are purposely retained to aid the leaching of the dense concentrates. The results of mixing all the grades of sized concentrates were better than obtained by separate treatment. The wet concentrates, together with a small quantity of caustic lime, are dumped into the leaching vats to a depth of about 3 feet, a vat charge approximating forty tons. Samples are taken from twenty to thirty 2-inch drill holes the full depth of the vat charge. The charge is first given a short water wash to take out soluble salts, formed in the wet mass by exposure to the air. After partial draining, the cyanide solution, together with the cyanogen-bromide solution, is run in. This is the strong liquor solution. The remaining wash water draining out is run through the zinc boxes. On the first appearance of gold-bearing solution, it is switched to the strong solution tank. This solution or strong liquor is used again and again without precipitation till it contains as much as six or seven ounces of gold to the ton. It is regarded as advantageous to precipitate this solution as infrequently as possible, as zinc decomposes cyanogen-bromide and the liquor is rendered less active. In the strong solution tank the switched solution, weak in KCy, is brought up to correct strength by adding it. In twenty-four hours it is found that 60% to 70% of the gold is in solution. The charge is drained and the charge reshoveled to expose fresh surfaces. Strong liquor is again run on till extraction is complete. A weak solution is then used for working and, the original thirteen tons of strong solution recovered, the stream is switched to the weak tank. The weak is then collected till sample shows it can be wasted, and the final wash water is then run through the zinc boxes. The weak solution, used several times, is always precipitated ahead of the strong. The liquor to be precipitated is run through the fume in the cone from the apex upward and overflows, freed of gold, into the settling box, thence, clear, to the sumps. The consumption of chemicals is found to be, per ton of concentrates treated: KCy, 2 pounds; cyanogen-bromide, .5 pound; zinc fume, 0.19 pound. Time of treatment, 80 to 100 hours. Extraction of gold, average 90.5%.—Condensed from P. Kirkegaard and S. B. Wright in Journal of Canadian Min. Inst.

In a recent issue of Le Genie Civil is published a short note describing a machine for increasing the oxygen content of air before using it in furnaces. The machine is said to be due to M. Mazza, an Italian engineer, and is merely a centrifugal separator. On passing air into this centrifugal machine the oxygen molecules, being heavier than the nitrogen ones, tend, it is stated, to concentrate at the periphery of the machine, and on drawing off the air at this surface it is found to be considerably richer in oxygen than normal air. In fact, the oxygen content can, it is said, be readily brought up to 26% of the total. Common air, it will be remembered, contains but 23.2 parts by weight of oxygen. The centrifugal machine used acts at the same time as a blowing fan, the enriched air being delivered under a slight pressure, while the impoverished air is drawn off continuously from near the center of the machine. About 2 H. P. is needed, it is stated, to operate a separator capable of delivering 18,000 cubic feet of enriched air per hour. This enriched air has been used for supplying the furnaces of a boiler, and has led, it is stated, to an increase of water evaporated per pound of coal from 9.5 pounds, with natural draft to over twelve pounds with the Mazza apparatus.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

GILA COUNTY.

Manager G. P. Andrews, of the Pinal Copper Co., reports at Globe that a new body of high-grade ore has been opened up on the lower level of the Black Copper mine.

A. C. Sieboth, superintendent of the Welch mine, owned by the Pinto Creek Copper Co., of Hancock, Mich., is sinking a double compartment shaft 250 feet. A road is to be built to the mines.

The Buckeye M. Co., of Cincinnati, Ohio, are preparing for the operation of their mine, in the Dos Cabezas mountains, near Bowie Station. Mr. Todhunter, of Cincinnati, is superintendent, and W. J. Larsen, formerly of Globe, is foreman.

GRAHAM COUNTY.

Tunnel No. 1 of the Standard, at Clifton, has cut a 2-foot vein of copper glance, from which a large amount of rich ore is being taken. The Standard now has glance ore averaging from 40% to 50%, and from 18 inches to 2 feet in width, in three different workings, besides second-grade ore averaging from 15% to 20%.

The Shannon mine at Clifton continues to show large high-grade ore bodies. W. T. Thompson, financial agent of the company, states that the strike of sulphide ore made in the Harrison tunnel runs 5.4% copper, and is a continuation of the great red West ore body, which in the Shannon tunnel, 70 feet above, is an oxidized ore, and on this level has changed to a sulphide ore.

MOHAVE COUNTY.

The machinery for the concentrating plant at the C. O. D. mine near Kingman is on the ground and it is expected that the new 100-ton plant will soon be in operation. The machinery for crushing consists of high speed steel rolls of large diameter, crushing wet. The product will then be sized by trommels and concentrated.

PINAL COUNTY.

F. M. Pool, J. H. Pool and J. L. Storry, all of Schultz, who own a copper mine in the Canada del Oro, have given the Eureka Dev. Co., of Calumet, Mich., a twelve months bond on the property, and the company has commenced development work. The general average of the ore exposed is good and one vein carries a small streak of 20% ore.

SANTA CRUZ COUNTY.

One of the oldest mines in Arizona is the Mowry, at Mowry camp, which has been worked since 1852. In the early 60's Col. Mowry of the U. S. Army bought it and sold lead to the Confederacy for making bullets, for which the Government confiscated the mine. The mine is owned in Tucson and is superintended by E. J. Gilbert. The ore is assorted into shipping grade, sent to the smelter direct, and a lower grade, which is concentrated at the mine before shipment.

YAVAPAI COUNTY.

The Summit mine, on the divide between Groom creek and the Hassayampa, has been bonded by Darrah & Stukeley of Walker. The main shaft, which is now down 90 feet, will be sunk several hundred feet deeper. M. Murphy, formerly of the Penn. G. M. Co., has been appointed superintendent of the mine.

At the Verde Con. C. M. Co.'s mine, near Jerome, the new shaft is developing ore assaying 3½% copper and \$6 gold per ton.

At the Monarch G. & C. M. Co., development work on the strike of the new shaft on the eclipse claim is producing ore going \$50 in gold, which is now being milled.

ARKANSAS.

BOONE COUNTY.

S. Nathan, formerly of Cripple Creek, Colo., states in Denver of the Arkansas zinc mining field: "It is a new old country, in that zinc has been found there for years; but the native is slow and poor, and experienced mining men must have ignored the possibilities of the fields, which are 20 miles from a railroad. The veins run in blankets and fissures, and some of the shafts are down 300 feet, but from 50 to 100 feet is the average depth. The Alma M. Co. is taking out \$100 a day and has its own mill. Other mills have been built and are going up. The veins run from 10% to 50% in zinc."

CALIFORNIA.

AMADOR COUNTY.

The east shaft of the Kennedy has been sunk to 2400 feet. At the 2100 level connection has been made with the workings of the west shaft. The east shaft will be continued down. The company plans to

erect a new 80-stamp mill near the east shaft next summer, believing both it and the present 40-stamp mill can be kept supplied with ore for an indefinite period. The ore body is 100 feet wide in places, of low grade, but paying.

At the Argonaut mine the shaft is down 1850 feet and is being deepened.

The mines near Jackson and Sutter Creek using petroleum fuel have storage provision for oil to carry over the winter season. The contract with D. McCall, who delivers oil to the mines, has required each mine to erect storage tanks capable of holding sufficient fuel to last 100 days. The Oneida has a tank to hold 2400 barrels, the Kennedy 1500, and the South Eureka and Lincoln 1200 barrels each. The mine owners continue to be well satisfied with oil as fuel.

BUTTE COUNTY.

The Pershbaker or Magalia drift mine at Magalia, it is reported, will be reopened by Steifer Bros., who have bought the claim north of it, and will buy the old plant to work through the old shaft and tunnel.

The Henderson mine at Wyandotte continues to prospect well.

CALAVERAS COUNTY.

It is reported that a rich strike has been made at the Duchess mine, near Vallecito, and that extra men have been put on duty and the ore is being sacked up and guarded. The Duchess mine is owned by an Eastern company and W. E. Emery is the superintendent and manager. The mine is situated on the north side of the Stanislaus river directly opposite the Dunsmore mine, in Tuolumne county. A large mill will soon be in readiness to run on the Duchess.

At the Melones mine, at Robinson's Ferry, the ore bin at the new mill is finished and the framework of the mill building is being put up. Work on the dam has reached a stage that no danger is now anticipated from high water.

A company has been formed to buy the Prince mine at Altaville, which will then be unwatered and the shaft sunk deeper.

The Oriole M. Co. stockholders' meeting in Stockton elected H. Hildreth president and J. B. Frietas secretary. The work at the mine near San Andreas is being done at the fourth and fifth levels.

A debris restraining dam on O'Neill's creek, near San Andreas, has been completed by W. Coulter, the engineer in charge.

C. W. Getchell and M. Donnallan own an extension of the Sheep Ranch ledge on the southeast. A tunnel is being run in the lead and 100 feet more heading is expected to take it into a large body of ore.

EL DORADO COUNTY.

J. McGraw of Kelsey reports \$1000 as the result of a cleanup of a month's run at the McGraw mine at Kelsey. This mine is equipped with a 5-stamp mill. B. L. Peters is superintendent.

The Burnham mine, near Placerville, has been bought by G. W. H. Master. The mine is equipped with a Huntington mill.

The new 20-stamp mill at the River Hill mine, near Placerville, is in operation. The stamps weigh 1200 pounds each. At present ore is taken from the Gentle Annie mine. The frame for the new hoist at the River Hill is in place but the new shaft is being sunk yet with the small hoist. It is down over 400 feet and it connected with the older works at the 400-foot level of the Gentle Annie shaft.

INYO COUNTY.

The old Panamint mine, that has been closed down for twenty-five years is to be reopened. It is located at an altitude of 10,000 feet on Telescope Peak, over the range from Death valley. The equipment of the mine consists of a smelter, a 200 H. P. engine, two 200 H. P. boilers, an assay plant, several discarded 10-stamp batteries, one good one. The property was bought at Sheriff's sale to satisfy an indebtedness for delinquent taxes of \$5000 or \$6000 by a Mr. Pedley. The latter has appointed Mr. Stebbins of Ballarat as manager. Concentrators have been put in and the concentrates will be treated on the ground; a crusher is also being installed. The roads leading to the mine have been repaired.

MONO COUNTY.

At the Sweetwater Con. mine, near Bridgeport, the boiler and engine are in place, and the battery and rock breaker are being set up. The mill, which was badly wrecked by a cloudburst, will be in shape for operation early next spring.

NEVADA COUNTY.

The Cold Spring, Fountain Head and other gravel mines on Washington ridge have been bonded to a San Francisco company, headed by R. I. Thomas. It is expected that the promoters will put in considerable machinery for development.

The Kentucky mine on Kentucky flat, near Nevada City, is being developed by

Kohler & Smith, who have run a tunnel 120 feet along a 16-inch ledge which is estimated to go about \$15 to the ton. The owners hope to erect a stamp mill next spring.

Work at the Coe mine, near Grass Valley, has been suspended and the property may be closed down.

Mill tests made on rock from the Bonnie Bee, near Emigrant Gap, show for one ledge 4 feet in width \$7 per ton; for another 6 feet wide \$26 per ton, and for the third, a 12-foot ledge, \$42 per ton. According to trials the concentrates go 5% and pay \$206 per ton. The company has worked sufficient ore in a 4-stamp mill to pay running expenses for almost a year, but is now contemplating the erection of a 12-stamp mill.

A mine is being developed near You Bet by C. W. Jones and H. W. Gendar of Grass Valley and J. Goodwin of You Bet. They recently took an old shaft 47 feet deep, retimbered it, and cleared out the water. Since then they have extended the shaft and uncovered a ledge 17 inches in width, the ore assaying from \$18.82 to \$72 per ton. The rock carries about 3% sulphurets.

C. Weisenburger has started to erect hoisting and pumping works on the Posey mine, in Willow valley, near Nevada City, which was recently bonded by a company represented by W. H. Bray. The machinery will be entirely new, except the pumping plant will be taken from the Miliken mine on the Washington ridge.

The Eureka mine on Gold Flat, near Nevada City, idle for eight years, has been bonded by R. Simmons Jr. and J. Poyer to a Mr. James of Los Angeles, who, it is said, intends to put on hoisting and pumping machinery. B. Hoskins of Los Angeles will be Supt.

R. M. Donne and C. M. Root are arranging to begin operations on the French quartz mine, near Moore's flat.

The annual stockholders' meeting of the Mount Blanc Gravel M. Co. at Grass Valley elected D. B. Marwick president, J. Watt treasurer and A. B. Brady secretary. The company's mine is at North Bloomfield.

PLACER COUNTY.

The Sailor Con. M. Co. of San Francisco is developing the Sailor drift mine at Canada Hill. The new tunnel is in about 420 feet and has passed through 50 feet of good looking gravel in the bottom of the channel. The company owns patented ground and claims covering 480 acres. N. A. Harris of San Francisco is president of the company and W. Duffy is Supt. in charge of the mine.

The Hathaway quartz mine, near Newcastle, is working twenty men. The mill is running steadily. The main shaft is 815 feet deep. A. B. Eastwood is Supt.

The channel of the Gray Eagle mine has been rediscovered in the Wolverine claim of the Anthony Clark group, adjoining, and it is said is paying \$10 a carload. W. H. H. Hart of San Francisco is prospecting the mine under a bond. T. G. Durning is the Supt. The discovery is 25 feet below the tunnel level.

PLUMAS COUNTY.

Gravel has been struck in the lower tunnel on the West Elizabeth mine on Poplar creek, near Quincy, by R. R. Gumbert. The gravel is reported to be rich enough to pay well for drifting.

SAN BERNARDINO COUNTY.

A rich strike is reported made in the mine of the Ludlow M. Co., Buckeye district, San Bernardino. In the last 8 feet of the tunnel a large ledge of pay ore has been struck. E. H. Staggs of Randsburg is one of the owners.

SHASTA COUNTY.

Supt. A. A. Anthony of the Central gold mine, at Old Diggings, has been ordered by Whitehouse & Bliss of New York to reopen the property and commence expensive development. The mine, which has produced more than \$100,000, has been idle for a number of years. The ore will be shipped to Keswick to be smelted.

The Rossman group of copper claims near Stillwater has been bonded at \$25,000 by J. S. Jennings to Eastern capitalists. The claims are owned by R. H. Rossman, Mrs. W. Obst, T. Jaegal and G. Bauer of Redding.

J. Lawyer and H. Thompson have taken a year's lease on the Reid mine, at Old Diggings, and will ship ore to Keswick.

The Brush Canyon group of eight claims, near Copper City, owned by W. Ellis, J. W. Snell, P. Sheehan and J. L. Cannon of Copper City, have given Mr. Cannon and R. Small of Redding a year's option of purchase at \$20,000. It is said that the property is to be handled through W. F. Mitchell of Salt Lake City, Utah.

SIERRA COUNTY.

An increased flow of water has been struck in the shaft at the Belcher mine, near Downieville, forcing the abandonment of sinking until a larger pump can

be put in. The tunnel is being driven ahead with two shifts.

Development work at the Dudley mine, situated at Forest, worked under a bond by Los Angeles people, is being rapidly pushed. H. Murray of Los Angeles is Supt., and H. M. Bradbury of Forest foreman.

SISKIYOU COUNTY.

The Flag mine, near Yreka, operated by B. Kinyon, is showing a fine body of high-grade ore, which will be milled in an arrastra.—The Craggy mine, operated by Nutter & Elliot, is developing a vein of good paying ore.—The old Knapp mine has been opened and is being operated by J. Locke and B. Fairchild of Yreka.

F. Mahler is seeking to secure the Yreka Creek valley, between the southern boundary of Yreka and the Blue Gravel mine on Greenhorn, to put in a dredger. The work is to be undertaken by Eastern capitalists, for whom Mr. Mahler is acting.

TRINITY COUNTY.

C. D. Galvin, managing owner of the Galvin Dredging Co., at Weaverville, has started work on the Ajax mine on Oregon mountain. It comprises 1800 acres and adjoins the Sweepstake, being its extension southward.

TUOLUMNE COUNTY.

J. T. Newcomer has sold to A. Elliot a half interest in the Newcomer mine, Knights creek, near Sonora.

C. Atherton and J. Bartlett have taken out an \$8000 pocket from the mine near Jackass Hill, Tuttle town, which they are working under a lease from A. Vincent.

At the Mt. Hood mine, near Tuttle town, eleven men are at work. A road is being built to the mine. An engine and boiler will be put in when the road is completed, and sinking will be commenced. The property is owned by San Jose people. J. Burkhart is Supt.

At the Badger mine, near Rawhide, on Bear creek, eight men are sinking and retimbering an old shaft. G. Stayton is Supt. and W. Kahl foreman.

The Clio mill, at Jacksonville, has been shut down and work in the main shaft has ceased. Three shifts are engaged in running a tunnel to connect with the old works. The abandonment of work in the main shaft is said to be due to the shifting character of the surrounding ground.

The Mountain Water & Electric Co. has been incorporated to supply water and electric power from the Tuolumne river for mining and irrigation. The Board of Directors are: J. M. Castle, J. P. Spooner, F. R. Clarke, W. B. Harrison and L. A. Richards—all of Stockton. They own a large gravel mine at Philadelphia Diggings.

YUBA COUNTY.

The Last Chance M. Co. has been incorporated at Marysville; capital \$25,000. M. Sullivan, J. C. Lumbard, W. H. Carlin, M. A. Nurse, O. G. Hopkins and A. D. West are the directors.

COLORADO.

ARAPAHOE COUNTY.

The Brock M. & M. Co. has been incorporated by H. D. McMaster, R. S. Brock and F. M. Young of Denver. The capital is \$1,500,000.

BOULDER COUNTY.

At the annual stockholders' meeting of the Leviathan M. Co. at Denver E. E. Ives of Emporia, Kan., was elected president and F. W. Sears of Denver secretary, treasurer and general manager. The Leviathan M. Co. owns a tunnel claim in Ward mining district, situated near Camp Talcott, which will cut seventeen lodes owned by the company, besides the Ward-Rose, Puzzler, Chief and other producing veins in Saw Mill mountain. Good ore has been opened in a blind vein. It is proposed to equip the tunnel with a plant of machinery, including power drills.

The Slide, at Wall Street, owned by W. Teller, J. S. Sanderson, and the Seymour heirs, is being worked by leasers. Wilson & Andrews took a lease on one of the Slide levels, paying 33½% royalty, and in two weeks made \$1100 each clear. An 18-inch streak of ore went \$200 per ton in carload lots. The mine is down altogether 1100 feet, and at that depth is in a sulphide ore which runs \$18 to \$25 in a crude state. The work is now principally in the 800 and 700-foot levels. Some ore is sacked which goes \$600. About fifty tons of ore are shipped per month.

CLEAR CREEK COUNTY.

The Good Enough M., M. & T. Co. has secured from A. Shepard control of the Eclipse tunnel and the Gold King, Gold Prince, Homestead and Little Winnie lode, near Georgetown. The company is incorporated for \$500,000 and its officers are M. L. Chapman president, F. C. Adams secretary and treasurer, and C. W. Badgley general manager, all of Denver. Work will be started at once on the Eclipse tunnel, which is now in 800 feet, and will be driven ahead to the Gold

King vein, which it will cut at depth of 600 feet from the surface.

J. E. Wallis of Boston, Mass., has taken up the bond on the Morning Star mine for the Abbandwal Co. J. Owen, the owner, has been appointed manager. It is the intention to put on a plant of machinery to work in the surface pocket, also in the Newhouse tunnel.

The Ann Rutledge G. M. Co. has been incorporated at Denver and will work the North Star lode in Vermillion district. It is reported that a plant of machinery will be put on the property before the bad weather sets in, so that developments can be kept up all winter.

During the first week of September the shipments of ore and tailings from this county for treatment amounted to 1369 tons.

A strike has been made in the Commonwealth mine, in East Argentine, owned by the Waldorf M. Co. From 3 to 4 feet of ore has been opened out which will run from 200 to 300 ounces silver and about an ounce in gold per ton. The mine is being reopened after an idleness of several years.

Four feet of ore that will run five ounces gold per ton is reported opened up in the Centennial mine, in Georgetown. The Centennial is strictly a gold mine, and has produced nearly a half million dollars. It is now being operated by Boston people, with S. G. Evans manager.

W. H. Smith of Denver confirms the sale of the Edgarden mine, at Idaho Springs, to R. B. Ragland and associates. This property is on the Newhouse tunnel, and where out there is a vein of 6 feet of ore. The mine has a steam hoist, and it is intended to contract with the tunnel owners for development of the lode through it. The shaft is down about 300 feet.

CHAFFEE COUNTY.

Turret camp has a strike of copper and gold ore in the Independence mine showing 10% to 30% copper and \$6 to \$12 in gold. The owners are sinking a shaft.

The Vivendur mine is yielding ore that will run more than \$130 per ton. Placer gold has been discovered at the postoffice in Turret. In putting down a driven well the core was taken from the pipe and panned, showing gold.

GILPIN COUNTY.

Two shifts are sinking the O'Neill shaft, near Central City, now 610 feet deep, and the intention of the management is to sink until a depth of 1000 feet has been reached. The property is operated by the Ontario & Colorado G. M. Co. with H. C. Eastman as Supt.

HINSDALE COUNTY.

(Special Correspondence).—The Ute & Ulay, on Henson creek, is now the property of the Auric M. Co., of which S. D. Nicholson is manager, the interests of English holders having been purchased by Colorado men. Within the last eighteen months a lower tunnel has been driven 2800 feet, crosscutting the Ute vein 300 feet below any of the upper workings, a connection having been made by an upraise. Another deep tunnel will soon be commenced on the opposite side of the creek, designed to cut the Ulay vein at great depth. The latter has never been extensively developed.

The Ute & Ulay mill, which makes jig and buddle products, turns out fifteen to twenty tons of concentrates per day that runs 65% lead, with considerable values in gold and silver. Manager Nicholson states that this tonnage will be increased. This mill was erected fifteen years ago; the erection of a new, modern mill is contemplated.

The new steam-boller plant here consists of three high-pressure tubular boilers, 150 H. P. each, with an automatic water flushing device for carrying away the ashes and cinders.

John McLellan of Leadville is on the ground putting in a 20-drill air compressor of Ingersoll-Seargent make. It will be a cross-compound, with high pressure steam cylinders 16x42, low pressure 30x42; and high pressure air cylinders, 16x42, and low pressure 28x42. The flywheel has 33-inch face by 16 feet diameter. It is so arranged that the steam cylinders may be disconnected in case water power shall be used. The intercooler is 48 inches diameter by 14 feet high. The capacity of the compressor is 2250 cubic feet of free air per minute.

Lake City, Sept. 9.

(Special Correspondence).—The Megunticook Gold & Copper M. Co. of Boston, Mass., has done considerable work on the Contention mine, on Hotchkiss mountain, including a 1300-foot tunnel, which goes in on the strike of the ledge.

The Golden Fleece tunnel, which starts from a point only about 50 feet above the level of Lake San Christoval, has been driven 3200 feet into Hotchkiss mountain, and is still being advanced with power drills. It has cut one vein and is expected to cut the main vein of the property about 50 feet

ahead. Supt. Kilvert states that upraises will be made on both veins to the upper workings, and then all ore will be handled through this lower tunnel and the concentrating mill started again.

At a point in the Golden Fleece tunnel, 2000 feet from entrance, a branch tunnel strikes northwesterly into the grounds of the Hotchkiss Mountain Mining & Reduction Co., whose mine is locally known as the Black Crook. The latter was first opened up through a system of tunnels and shafts at a higher point, but now most of the work goes on through this Crook-Fleece tunnel, though some shipments are still made from the upper tunnels. A connection will be made between the lower tunnel and the upper workings. The ores carry lead, gold and silver, and so far the product has been strictly a shipping ore.

Both the Golden Fleece and Black Crook use power drills and air compressing plants.

Lake Shore, Sept. 9.

LAKE COUNTY.

The Mingo G. M. Co. at Leadville propose to put a 30 H. P. steam plant on the Mingo mine in Lake district. The shaft on this property is down 180 feet and is to be pushed on down.

Colorado Springs parties who have a bond on the London at Leadville are doing development work and will, it is reported, put in a small gasoline plant on the mine to replace a whim hoist.

Sinking has been resumed at the Chicago-Carr mine at Leadville at a depth of nearly 300 feet and Manager B. M. Myers says he intends going down 100 feet.

Work at the Rialto mine at Leadville has been started again by the Ridgewood G. M. Co., B. P. Hammond manager. The work of lowering the water is about completed and the company has received a Jeanesville station pump, capacity 1000 gallons a minute, and which will be lowered to a depth of 600 feet as soon as a station can be cut.

Diamond drill work upon the property of the Georgia Gulch M. Co., at Leadville, is in virgin territory. If the drill test is satisfactory the shaft will be sent down. J. V. Bohn is manager.

The Ohio M. Co.'s new shaft has been completed to 300 feet and drifts have been started. The ore has been found to increase in value with depth and the shaft is expected to develop pay ore.

The Ruby mine, on Iron hill, which has been shipping an average of from 800 to 1000 tons of lead sulphides per month, has had to curtail its product on account of the smelting companies refusing to receive that amount of ore. The Ruby produces ore running 17% to 18% lead, 30% iron and from 8 to 10 ounces in silver and a small amount of gold. The presence of lead in such quantities prevents the mine from finding a market with the pyritic smelter, so it is compelled to let the mineral stay in the mine.

OURAY COUNTY.

(Special Correspondence).—The smelting plant of the Home Pyritic Smelting Co. at Ouray is practically ready to blow in, and Supt. W. C. Laughlin says he will have a sufficient tonnage of copper and iron sulphides and oxides to keep the plant operating. It has one furnace of about seventy-five tons capacity, with Loder heating chamber and dust collector. The blower and crusher are operated by a Leffel water wheel of 250 H. P. The arrangement of ore bins for chuting different grades of ore to the charge floor is convenient and automatic.

The Yellow Jacket mine—five claims on Bear creek, near Ouray—belongs to C. E. Fryberger and G. Storm, who have driven a 500-foot tunnel to a strong body of ore 125 feet below the surface. Considerable of the ore sampled ran 30% Pb., to 30% zinc and twenty-five ounces to forty ounces silver to the ton. This mine is at an altitude of about 11,000 feet.

The American Gold M. Co. owns the American-Nettle mine, situate over 2000 feet above and overlooking the Uncompahgre stream, on which Ouray is located. A tramway 2100 feet long connects the mine with the mill in the valley. The underground work shows an upper and lower contact. The upper is extensively opened and has been a producer for years. At a point on the side of the mountain, 700 feet vertically below the upper workings, a tunnel will be driven 1000 feet on the horizontal ledge known as the lower contact. It is expected to recover ore bodies similar in size and character to those found on the upper contact.

The American-Nettle ores may be classed as first grade, consisting of oxidized iron and silicates carrying free gold; second grade, comprising sulphides of iron, lead and copper, having gold, silver and copper values. The smelting ore, shipped crude, runs ten ounces to fifteen ounces gold, and forty ounces to seventy ounces silver. This consists chiefly of the high-grade sulphides and oxides and amounts to forty or fifty tons per month. The mill, which handles about sixty tons

per day, is equipped with crusher, twenty stamps, amalgamating plates and four Wilfley tables. About 50% of the mill saving is on the plates and 50% in concentrates. Excepting where the material is oxidized, the ore is a hard quartzite gangue. In the chalcopryite ore the copper runs as high as 15%. The American Co. is made up largely of St. Louis, Mo., stockholders. The property is under the management of R. G. Hall, formerly with the Pueblo Smelting Co.

The Bachelor mine and mill ship 150 tons of crude ore and 150 tons of concentrates per month. The mill ores comprise a lead, zinc and iron sulphide, the concentrate products of which are all shipped together. This zinc concentrate is mixed with the lead product, because the former carries much of the silver. Supt. W. H. Bunc states that the concentrate shipped will run about 20% to 25% lead, 15% zinc and only about 3% iron. The gangue rock carries a high per cent of barium sulphate, or heavy spar, which goes with the concentrate as an insoluble residue.

The lower workings on the Bachelor are reached through a 500-foot shaft that sinks from the lower tunnel; levels Nos. 1, 2 and 3 from this shaft cut the vein at a distance of 150 feet. An upraise connects this work with the extensive workings on the higher levels. The Bachelor vein is opened up about 1300 feet longitudinally. The same vein is extensively opened on the adjoining Kehdive, Wedge and Nevada. G. R. Hurlburt is general manager of the Bachelor.

The Calope, belonging to C. H. Nix, is opened through a 600-foot tunnel, from the breast of which a shaft sinks 150 feet, and from the latter a crosscut runs 120 feet to the vein, on which there are over 500 feet of drifting. Pay ore in the vein ranges from 8 inches to 2 feet wide, the ores being a lead and iron sulphide, running well in gold, silver and lead. It is stated that some of it runs 1½ ounce to 2 ounces gold to the ton. Considerable stoping has been done and ore shipped from the drift below the tunnel level. The mill, which has ten stamps and concentrators, has been repaired and will soon be running again.

A short distance above the Calope is the El Mahdi, which belongs to Dennis Sullivan & Son of Denver and William Sullivan of Silverton. It is an old property which these parties took hold of two months ago. It comprises three claims, which are supposed to cover a portion of the Bachelor vein, which trends east and west. The old 100-foot shaft has been enlarged and retimbered and is being sunk 100 feet deeper, when a crosscut will be run to the vein. The ore is gold, silver and iron, in an iron and lead sulphide. Several years ago three carloads of ore from these workings were shipped that netted \$8000.

Ouray, Sept. 4.

PITKIN COUNTY.

(Special Correspondence).—The Hunter Creek M. Co., controlled by D. Brown of Aspen, is erecting a concentrating mill of 100 tons capacity near the entrance to the Cowenhoven tunnel at Aspen. The Della S. mine and others, which ship through the latter tunnel, are also controlled by Mr. Brown and associates. These mines, with the new mill, are in charge of Chas. Anderson as Supt. The ores produced are a silver-lead-zinc material, carried in a lime and heavy spar gangue. Some of the spar, or barytes, carries important silver values. Portions of the lime ore carry silver in chemical combination, in which case it is mined separately and not milled. It is stated that the crude ore will average about 6% lead and seven ounces silver. While most of the silver-lead ore here are in sulphide form, there are streaks of lead-zinc carbonates which are mined separately and not milled.

The new mill, which will be operating within a month, has a 20x6-inch crusher, two 30x14 rolls, two 6-foot Huntingtons, fourteen Wilfley tables, four Frue vanners—all to be operated by electric motors in the mill. The material, on leaving the rolls, is automatically sampled by a device of the mill owners. Most of the material is crushed and ground to sixty-mesh.

The Wilfleys here turn out, first, a coarse, heavy lead concentrate; second, a middling that passes through shaking launders to another set of Wilfleys; third, a quantity of barren tailings, comprising the lighter gangue; and fourth, the fine slimes that pass to hydraulic settlers and thence to the Frue vanners.

The entire concentrate product will pass to the drier, consisting of a steam heated chamber, 40 feet long, 30 inches wide and 1½ inch thick. This drier stands at an incline and the wet concentrates are slowly carried over it by scraping conveyors, by which the moisture will be reduced to 5%. The speed of all the tables will be governed by eighteen of the American expansion pulleys.

The San Jacinto mine, on the Castle creek side of Aspen mountain, has been

worked for years; but later developments are of interest. By driving a 350-foot tunnel high up toward the crest, ore was recently struck on the syncline contact. The same contact was also struck by a shaft driven at another point. Silver ore here in a lime-spar gangue ran \$100 per ton.

Aspen, Sept. 12.

SAN JUAN COUNTY.

(Special Correspondence).—The new Silver Lake mill is on the Animas, at the lower end of the 3-mile tramway from the Silver Lake mines. Since Manager S. I. Hallett took charge he has been making some changes in this mill, which will make it equal to about 400 tons daily capacity. There will be thirty-two Hallett tables, five Frue vanners, three Chili mills, four 14x27 and two 16x36 rolls; six twin jigs, with eight compartments to each twin. In place of the hydraulic classifiers he is putting in tandem shaking screens below each set of rolls and following the Chili mills. The five elevators have been reduced to two. The first one takes the entire mill product from the No. 1 rolls to automatic sampler and shaking screens; the second elevator takes the dry concentrates from the drier to the storage bins. Attached to the jigs are dewatering devices that take most of the water from the jig tailings before they pass to the rolls. The jigs will make three, five and eight-mesh products. The old spitzkasten, which is unusually long, is being replaced by three new ones in front of Chili mills, each to be five-compartment, 5 feet deep, 6 feet wide and 22 feet long.

The drier used consists of a steam chamber, 22 feet long, 30 inches thick, standing at an incline; and the concentrates are dried while passing over it to the boot of the second elevator.

The first operation of the mill is the passage of the ore over grizzlies to No. 1 crushing rolls, thence elevated to shaking screens of 3, 5, 8, 14 and 20 mesh respectively. The Nos. 3, 5 and 8-mesh product goes then to Nos. 1, 2 and 3 jigs, the fines going to Hallett tables. The tailings from Nos. 1, 2 and 3 jigs are carried to a set of 14x27 rolls, following which are shaking screens of 20, 40 and 100 mesh. The oversize of the 20-mesh and the middlings from tables go to Chili mills that grind to 30 mesh. The shaking screen following each Chili mill sizes to 50, 80 and 100 mesh. The 50 and 80-mesh products go to Hallett tables; the 100-mesh material goes to the spitzkastens, followed by vanner work.

In dewatering the fine concentrates as they pass to the drier the slimes go to settling tanks from which the water drains off. There is an automatic tailing sampler that does its work as the tailings pass from the mill.

Silver Lake ores carry about 70% silica and about 3% iron; the values being gold, silver, lead and copper. The lead is a galena. In concentrating there is a clean separation of the lead from the iron and copper, the last two going together. The gold is most of it in combination with the sulphides, though there is some in fine free particles in the quartz. The first-class product of the mill is a lead concentrate, with good gold values; the second grade is an iron and copper concentrate, carrying gold and silver.

The old mill, which is at the main tunnel level at the mine, has crushers, rolls, trommels, jigs and tables. The trommels size to 3, 4 and 10 mesh, the slimes therefrom passing to Wilfley tables. Two products are made from the twelve 4-compartment jigs, both of which are lead, carrying other values. The table concentrate goes as a copper product, with gold and silver. The jig tailings are recrushed by stamps, and go thence over trommels to the tables. The table tailings go to spitzkastens, are then dewatered and passed to eighteen belt concentrators, this final product joining the second grade. In the tailing pond at the old mill is a large tonnage of tailings. N. B. Wilcox, mechanical engineer, is superintending the work on the new mill and M. B. Pickel has charge of the old mill.

Silverton, Sept. 9.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Bessie mill, which originally was specially equipped for cyanide work, is being remodelled and altered to make of it a straight concentrating mill. The changes are being made by Supt. E. Millard, who will soon have it running with crusher, four sets rolls, eight Bartlett tables and two Frue vanners. The Bessie mine and mill are now consolidated with the Alta and it is understood the latter will furnish the bulk of the ore. Both mines are in Alta basin. A new tramway is being built from the Alta to the upper terminal of the Bessie tram.

In the same basin, but on the opposite side, is the Gold King, whose tunnels connect with the Suffolk work on the Ophir

side of the range. Gold King ores are remarkably free-milling, as is evidenced by the mill work done on the property. The mill operates twenty stamps, driven by electric motors connected with the Telluride P. & T. Co. plant below Ophir loop. The thirty-eight tons of ore crushed per day passes over plates, there being no concentrators. Mill Supt. E. S. Platner states that the plate tailings do not run over 80 cents per ton. The values caught run from \$15 to \$25 per ton.

In Turkey Creek basin are two principal groups—the Four Metals and the Turkey Creek. Both properties are under the management of J. H. Shockley, though the ownership of the two is not the same. John Osborne has direct supervision of development in progress on the two properties. The Four Metals is being opened and worked through three tunnels that run southeasterly along the strike of the vein. The lower tunnel has been driven 350 feet, the upper 250 feet and the intermediate about 1000 feet. On the last there has been some stoping the full length of the tunnel. The vein, as shown by the above work, will average about 5 feet wide. The bulk of the ore is milling grade, though there is a streak of shipping ore along with it that will average 1½ feet wide. The ore comprises gold quartz, lead sulphides carrying gold and silver, with a good deal of antimonial silver and chlorides. Four carloads of the higher grades were shipped in the month of August. Ore bins and other improvements are being made.

The Turkey Creek Co. are driving a 1000-foot crosscut tunnel to cut several parallel veins at considerable depth below their old workings. The ore here is quite free-milling. A small stamp mill is on the property, which has run part of the time. Turkey Creek basin has two or three small lakes which furnish ample water supply for all purposes.

Sultana, Sept. 1.

TELLER COUNTY.

J. McElwee of Midway leased on the Hanna Britt, on the summit of Bull hill, Cripple Creek, with the engagement to run a drift 300 feet long. He sold all but one-tenth of his interest to others who then explored the 200-foot level with a candlestick and discovered an ore body from 2 to 6 feet in width that runs from \$40 to \$100 in gold to the ton. There is a long stope of it and ten to fifteen tons a day of ore are being broken out, while McElwee, with his tenth interest, stands off and feels as good as could any man under the circumstances.

Supt. Trevarthen of the Portland Co., at Victor, says the production for September, judging by the shipments already made, should run over 9000 tons, an increase of about 2000 tons over average for a considerable time. About 600 men are at work and the ore showing is improved, especially in the 1000-foot level. The shaft is below the 1100-foot point, and the drift to the north on the main vein has been run for a distance of 75 feet.

The Consolidated Mines Co. has ordered a new plant of machinery for the Wild Horse mine, at Cripple Creek. A production of eighty tons daily is being maintained, which could be doubled, were the hoist to permit. Two double-deck cranes and a 16x20 first motion, double-drum hoist are included in the new machinery.

IDAHO.

IDAHO COUNTY.

Col. Dewey, owner of thirteen of the claims on Thunder mountain, has organized a \$5,000,000 company in Pittsburg, with W. H. Dewey of Nampa president and general manager, W. E. Gibson vice-president, J. J. Walsh secretary and A. Q. Lewis treasurer. It is stated that more men would be employed at the property this winter than ever before and that the mill would be in operation in a few days.

LEMHI COUNTY.

The Kittle Burton mine has been sold to Michigan people for \$50,000. The new owners will erect works and commence operations on a large scale.

OWYHEE COUNTY.

From the DeLamar mine at Silver City the ore body found several weeks ago on the fourth level west has since been opened on the fifth, and prospecting work is now said to be under way on the eighth and other levels of the mine.

Installing the electric pumping plant at the Poorman mine at Silver City will be completed and the plant will be in operation in a month. In the meantime the gasoline hoist is keeping the water out of the shaft, the flow having decreased some.

MONTANA.

GRANITE COUNTY.

The Granite Mountain and Bimetallic Con. M. Co. is enlarging its concentrator from a daily capacity of 100 tons to 600 tons daily capacity. There are said to be

some large bodies of low-grade concentrating ore in the lower levels that can be treated at a profit. The stamp mill is in operation.

LEWIS AND CLARKE COUNTY.

The Superior & Montana Dev. Co. has been organized at Houghton, Mich.; capital \$50,000, paid in \$30,000. The incorporators are J. McNaughton, J. H. Lathrop, T. Hoatson Jr. of the Calumet & Hecla, J. R. Dee, J. H. Rice, R. M. Edwards, B. F. Chynoweth, L. Karger, M. Van Orden, R. H. Shields, J. Strubel, S. H. Brady, W. G. Rice of Houghton and G. Wallace of Marquette. J. R. Dee is president. The company holds an option on the Gold Belt mines near Marysville.

MADISON COUNTY.

G. D. B. Turner and C. Austin have taken a bond on the Pole Creek placer mines, owned by A. W. Tanner, who recently found a Ruby weighing over 500 carats. These mines pay well in gold besides the large number of garnets and rubies which are obtained as a bi-product. Outside capital has been taken in and it is proposed to work the mines on an extensive scale next year.

SILVER BOW COUNTY.

F. A. Heinze, who is now operating the Minnie Healey mine, is making improvements at the property. A new hoist has been put in with uprights 85 feet high, made of timbers 2 feet square and angle braces 110 feet long. A new Corliss engine has also been put in. About 100 men work in the mine and thirty-five on the surface, and 600 tons of ore are taken out daily.

NEVADA.

HUMBOLDT COUNTY.

The American Niter Co., which owns niter deposits 10 miles from Lovelock, is starting operations. Experiments have been made, and it is believed that a practical way of handling the crude material has been found. The principal products are sodium nitrate and a very fine quality of table salt. It is said that the niter belt extends for several miles along the Humboldt foothills.

J. A. Nelson's copper mines in Jackson Creek district, near Winnemucca, have been bought by Zellerbach, Hooker & Co. and D. Johnston. The price was \$40,000, upon which a payment has been made. It is stated that the new owners intend to erect a smelter and concentrator at the mines. There are already about 1000 tons of ore on the dumps.

LINCOLN COUNTY.

The Meadow Valley mine and many others at Pioche, bought recently by the Manhattan M. Co., have been started up, with E. F. Freudenthal as manager. The smelter and the railroad to Jackrabbit are being repaired.

H. M. Knight of Galveston, Tex., is examining the old Felix Knight mines, at Silver Park, with a view to reopening them.

LYON COUNTY.

The Miller Bros. have given an option to Capt. DeLamar for six months on the Douglass copper mine, near Delphi, at, it said, \$300,000.

A Mr. Pugh has bonded the Ludwig properties, near Yerrington, and is putting in a 35-ton smelter, expecting it to be in operation by Oct. 1. On the 200-foot level rich copper is being taken out.

The Cuyahoga G. M. & M. Co. is putting in a 25-ton cyanide plant in Mason valley. Ore running as high as \$60 a ton is being mined.

NYE COUNTY.

Returns from the smelter amounting to \$34,416.77 net, after deduction of railroad, freight and treatment charges, have been received by Tonopah leasers. The highest was on four tons of ore shipped by the Tonopah Co., which yielded \$705 per ton. The average value per ton on all returns received is about \$196 per ton. One lease received \$7918 and another lease \$6885. On the 11th inst. sixty-three tons of ore, value about \$10,000, were shipped from the camp. There are now on the road hauling ore and freight between Sodaville and Tonopah 310 animals.

WASHOE COUNTY.

(Special Correspondence).—Most of the copper prospects on Peavine mountain have lain idle since the closing down of the two smelters in Reno a year ago. The installation of a new smelter recently, and prospect of another soon, has started work on the mines again.

Redman & Holesworth will work soon on Anaconda No. 2, out of which last year they shipped two cars of high-grade copper ore.

A. B. Updike has a copper prospect and has done considerable on it.

The gold properties at Steamboat Springs are showing well, despite the difficulty of work arising from the ground heat from the boiling springs. At a depth

of 45 feet in onyx and quartz free gold ore has been struck assaying \$45 per ton.

The Senator M. Co., a new organization, has bought 120 acres adjoining the springs. Machinery is being installed and work will begin at once. The railroad runs across this property.

W. M. Billing, T. Degman, C. T. Zintz and F. Handrich have three claims near Steamboat Springs. Two of them run through the hot water formation, on which there is a good showing of ore exposed by open cut and shaft. The Copper Queen shows a 10-foot ledge between slate and basalt walls. There is a 25-foot open cut and a 40-foot tunnel, the ore increasing with depth. It carries \$12 in copper, besides silver and gold.

At Washoe the Monte Carlo mine is being worked for copper and gold. It is a large deposit. The owners are A. B. Updike and Mickell, Bready & Greiner.

The California-Nevada Copper M. & S. Co. have bonded from the Nevada Exploration Co. a mine on Peavine mountain, 20 miles north of Reno. The ore shows copper, gold and silver. Tunnels have recently located a vein of copper ore which shows up well.

Two claims owned by Norton & Bidwell, about 27 miles north of Reno and near Pyramid lake, have been bonded by C. A. Norcross of Washington, D. C., for an Eastern company. The property covers 3000 feet of gold and silver-bearing ledge, outcropping from 12 to 80 feet wide. The company has erected buildings, assay office, whim, track and ore cars have been put in. A shaft is down 70 feet, with crossdrifts from the bottom about 30 feet each way on the ledge. The vein is in an andesite fissure. Working tests of selected ores indicate an average value of about \$15 per ton. The company have recently taken up the bond and expect to continue development work through the winter, and in the spring erect reduction works.

The Copper Queen, 3 miles northwest of Reno, has a 12-foot wide ledge. The ore is a carbonate and runs 3% to 15% copper. The owners say they have 3000 tons of ore in sight. J. A. Pothoff, Norcross Bros. and D. W. Cutts are the owners.

Reno, Sept. 12.

NEW MEXICO.

GRANT COUNTY.

Representatives of the American Con. Copper Co. of New York are making an examination of its copper mines at Lordsburg to decide upon the erection of a plant and method of treatment which the company will install. The company has more than 10,000 tons of ore on its dumps and is opening up new ore bodies. The company is interested in the Burro mountain mining district, 27 miles northwest, but it is thought that Lordsburg will be selected as the point for the establishment of the plant. In the party are A. E. Gibson of Santa Fe, president of the company; W. Z. McDonald of New York, secretary; D. A. Walker of Columbus, Ohio, treasurer.

J. A. Hulit, of Silver City assay office, has been appointed superintendent of the development work on the claims of the Navajo Copper Co. at Burros, and is now working a few men sinking a shaft.

W. B. Hayden and R. Y. Anderson intend to resume work on the King at Organ. In a drift from the 100-foot level a 60-foot lode of iron carrying blue and gray copper and gold in quartz has been cut.

The Little Jessie and Copper Glance groups, in the Mogollon district, has been bought by C. M. Foraker, G. L. Rooks and W. S. Stickler of Albuquerque. The new owners will incorporate.

S. W. Winn of the Mineral Mountain M. Co. has bought a hoisting and pumping plant for the company's mines at Stein's Pass. Later the company expects to erect a concentrator.

RIO ARriba COUNTY.

The Silver Bar Copper Co., operating the Cooney mine, expects soon to pay its third dividend. The company has \$10,000 worth of ore at the mills. The main shaft is down 325 feet, the producing vein being 6 feet wide, averaging 15% copper for the entire width. The concentrates, which are made from about four tons of ore into one, average 52% for the entire production. Thirty men are employed. The property is practically in control of nine Colorado Springs mining men, headed by D. P. Sill.

TAOS COUNTY.

W. Fraser of Taos states that the new smelter will be built near Taos in the spring, the reduction works probably including a leaching plant.

OREGON.

JACKSON COUNTY.

The main shaft on the Ashland ledge, at Ashland, is now down 765 feet. Drifting on both sides of the shaft at the 700-foot level is being done. At this depth the

ledge averages about 7 feet in thickness, and is free-milling ore, with values much above the average. Stopping is being done from the 400-foot level down. The company contemplates putting in an air plant and introducing machine drills. At present steam is used to operate the mine, the machinery being located in a chamber on the 250-foot level, which is at the junction of the big east tunnel with the main shaft. Thirty men are employed. The company has a mill, provided with four concentrators, for which exceptionally good work is claimed. The Supt. reports that since the improvements in the mill were made the tailings average in value only 63 cents per ton.

UMATILLA COUNTY.

Z. Houser is building a smelter at the mines of the Standard Smelter Co., in the Dixie Butte country, south from Pendleton, in the Blue mountains. The smelter is of small capacity, but will do the work of the company for the present. J. J. Parker of Portland is in charge of the installation, with M. L. Hasbrouck doing the building.

UTAH.

BEAVER COUNTY.

The Klondike Copper M. Co. has been incorporated at Salt Lake City; capital \$200,000. The company is the owner of the Klondike, Klondike Extension, O. K. and Ben Harrison claims near Milford. J. S. Thompson is named as president, J. M. Hallaway treasurer and J. J. Treman secretary.

BOX ELDER COUNTY.

The Old Vag G. M. Co. has been incorporated in Salt Lake City; capital \$25,000. C. M. McEntire is president and J. L. Perkes secretary and treasurer. The company owns the Old Vag, Old Bum, Now Visible and El Oro Nos. 5 and 6, in Park valley.

GRAND COUNTY.

The Little Dab property, on Mineral mountain, at Basin, is producing rich bismuth silver ore. Davis Bros. and R. J. Thompson of Moab are leasing the mine. The value of the best ore now being taken out will run about 600 ounces silver, with some gold and copper.

JUAB COUNTY.

The Swansea M. Co., at Tintic, has let a contract to W. Hatfield, J. C. Sullivan and J. Nolan to sink the main shaft 200 feet from the 850-foot level. The company furnishes everything and hoist the waste and water, and pays \$16 per foot. Until the work is finished other operations underground have been discontinued.

SALT LAKE COUNTY.

The Southworth M. & M. Co. has been incorporated in Salt Lake City; capital \$30,000. It owns the Lucky Boy, Highland Boy Nos. 1 and 2 and Foote Nos. 1 and 2 claims in Farmington canyon. H. F. Southworth is president and J. E. Foote secretary and treasurer.

The Rocky Mountain S. & R. Co., with a plant at Florence, Colo., is said to be planning for a pyritic plant near Bingham and has secured a refusal of the Samson, the Yosemite and other claims now owned by the Western Exp. Co. at Bingham.

SUMMIT COUNTY.

The Wabash M. Co., capital \$200,000, has been incorporated; N. Treweek is president, H. S. Joseph secretary and W. Mont Ferry treasurer. The claims of the Wabash M. Co. consist of the Clara No. 2, Starmont, Helen Jessie, Wizard, Wizard No. 2, Frederick and Superior, about forty acres, near the Ontario at Park City.

TOOELE COUNTY.

The Sevier mine at Gold mountain has been sold by C. Lammersdorf, C. K. McCormick and A. E. Hyde to the Western Exploration Co., \$25,000 being paid down on account of \$125,000. W. F. Snyder, as president of the company, made the contract.

The Gracey M. & M. Co. has been incorporated at Waxahachie, Tex.; capital \$50,000, with J. F. Strickland, H. Kelland, J. A. Gracey, J. H. Miller, J. C. Smith, J. F. Wyatt and T. M. Sleeper directors. J. H. Schofield of Tooele county is appointed State agent in Utah.

The mill of the Sunshine M. Co. at Mercur is being remodeled by G. C. Moore of Salt Lake City, who is operating under an option. He is looking for latest devices in the leaching of low-grade gold ores. The more important of the new devices to be introduced is a successful slime treatment, the metal of which has been a dead loss. Discussing a new ore body recently uncovered on the 200-foot level, the management says that while some of it shows \$14 per ton in gold, the average rules at \$5.50, and can be made to pay dividends.

WASHINGTON COUNTY.

The Grand Gulch M. Co., operating a mine near St. George, is shipping ore that runs about 46% copper, without counting other values. So far nineteen cars have

an average of 45% copper. The cost of transportation is \$30 a ton from the mine to Salt Lake City. With 10,000 tons or more of the ore blocked out the company next spring expects to begin the erection of a smelter at the mine.

B. Jarvis, J. C. Keate and associates have incorporated the West Point Copper M. Co., to operate eight claims at St. George. The work of developing will be begun at once.

WASHINGTON.

YAKIMA COUNTY.

The Aurora Bar G. M. Co., R. T. Pettengill president, S. B. Herron secretary and general manager, with office in Spokane, will develop a deposit of placer gold near the village of Thorpe, in the bars of the Yakima river. The company have leases for 7 miles of the river banks, and tests have been made and the value of the ground proved. The bars are in the Yakima river just below the mouth of the Swauk creek, the Tanum and other streams that drain the east slope of the Cascade range, where many free-milling veins are found. Not only do the river bars contain gold, but there is gold in the dirt far back from the river. It is not flour gold, but coarse enough to be readily saved, together with black gold-bearing sand that can be sold at smelters. The plans of the company propose the installation of a dredger.

FOREIGN.

BRITISH COLUMBIA.

A smelter will be built at Marysville, B. C., to treat the silver-lead ore from the Sullivan group of mines. Work will begin at once and it is expected that the plant will be ready for operation by April 1 next. The company expects to mill and smelt its ores at a cost of not exceeding \$12 per ton. There are said to be 150,000 tons of ore on the dump and in sight. Among the interested parties are I. N. Peyton, E. Sanders, W. M. Ridpath and J. M. Armstrong of Spokane, Wash.

The tests recently made at the St. Eugene mill, at Moyle, on the second-class ore from the Keep Cool mine, show that without using either slime tables or vanners it is possible to make a five to one concentrate, giving 74% of the lead values and 80% of the silver values. The Keep Cool Co. is planning to send three tons of typical ore to Denver for metallurgical tests, to determine what process of concentration is most suitable. The company is planning to put up a mill.

A proposal has been made by A. Geiser of Baker City, Or., to take a contract to work the Le Roi mines at Roseland, B. C. Mr. Geiser has paid a visit to the mines and has been furnished by B. MacDonald, the manager, with a list of the prices paid for labor in the mines before making a definite offer of terms. He will offer to take a contract to deliver lime at the smelter at Northport.

Work has been started on the Britannia mines at Howe Sound recently bought by a Butte syndicate. F. M. Leonard, manager of the company, states that Mr. Heinze has no interest in the property.

G. W. Averill of Roseland has bonded the Banner claim, Summit camp, to a Dr. Hindly of Minneapolis, Minn. A shaft 85 feet deep is in ore, which averages \$20 in copper and gold values. A company is to be organized at Minneapolis to develop the property.

MEXICO.

In the Ures district of Sonora, near Hermosillo, are the mines of the Gabilan M. Co., J. L. Green manager, upon which development work is being done. The mine known as the Gabilan includes the La Luz, El Porvenir and San Jose claims, through which there runs a ledge 4 feet in width. A foot of this ledge yields silver ores running from 1000 to 8000 ounces per ton, and the remainder yields ores which pay well. These claims were worked by former owners many years ago, and the old workings followed the ledge upon inclines. Now a vertical, double-compartment shaft is being sunk which will cut the vein at a depth of several hundred feet.

J. D. Fresh and J. Penman have interested Eastern capital in their copper properties, 35 miles west from Hermosillo, and a company has been organized to develop and exploit them. The incorporators are J. C. Campbell of St. Louis and J. W. Simpson of Brunswick, Mo. Development work is now being done with J. D. Fresh as manager.

NEW SOUTH WALES.

The output of the Broken Hill Proprietary Co. for the year ending May 31, 1901, is reported as follows: Silver, 3,009,164 fine ounces, against 2,780,937 ounces for the previous half year, the price realized being 3½d per ounce less; lead, 27,869 tons, against 21,855 tons, returning an average of \$3 11s 6d per ton less than was obtained for the previous period.

Personal.

H. P. LEWIS of New York is at Phoenix, Ariz.

J. D. SCHUYLER, C. E., of Los Angeles, Cal., is in San Francisco.

J. V. HARMON of Butte, Mont., is visiting Salt Lake City, Utah.

F. F. FRIANT has been appointed Supt. Castle Dome mine, near Yuma, Ariz.

C. E. LOOSE of Joseph, Utah, has returned to that place from Houghton, Mich.

R. NICHOLS, lately in Koolgardie, West Australia, is now at Salt Lake City, Utah.

C. AMSDEN has returned from a six months' trip to South America, to Bisbee, Arizona.

M. J. O'MEARA of Tonopah, Nev., is sojourning in Salt Lake City, Utah, for a few days.

E. JONES has been appointed superintendent of the Sacramento mine at Mercur, Utah.

J. V. FLEMING has resigned as superintendent of the Silver King mill at Park City, Utah.

C. I. RADER has been appointed superintendent of the Annie Laurie mine, Kimberly, Utah.

FRANK HALL has resigned as general manager of the Sweepstake M. Co., operating at Weaverville, Cal.

O. P. POSEY, general manager Bingham Con. M. Co., at Bingham, Utah, is sojourning at his home in Los Angeles, Cal.

W. C. RALSTON, manager of the Melones mine, at Angels Camp, Cal., has returned there from a visit to New Mexico.

J. P. TURNER of Salt Lake City, Utah, has been appointed consulting engineer of the Bonanza M. Co. at Park City, Utah.

J. D. HAGUE, manager of the North Star M. Co., was in Grass Valley, Cal., this week inspecting the mines of the company.

J. A. KIRBY, Supt. Daly-West mine, at Park City, Utah, has returned there from Ploche, Nev., where he has been examining mines.

J. A. ANDERSON, manager of the Tonopah M. Co., of Tonopah, Nev., has returned to the mine from a visit to Philadelphia, Pa.

G. L. KEENER, manager of the Mary McKinney mine, at Cripple Creek, Colo., has also taken charge of the Eclipse mine at the same place, the two properties having been consolidated.

Commercial Paragraphs.

CRANE CO. has this summer erected at its works at Jefferson, Van Buren and Desplaines streets, Chicago, a foundry which is to be devoted exclusively to very heavy work, i. e., flanged fittings and large valves. It is equipped with two cupolas, an electric traveling crane, and every other modern convenience. This new foundry will increase Crane Co.'s capacity for very heavy work about 50%; it will be in operation Nov. 1st.

THE recent robbing of the vault of the Selby Smelting Co., at Crockett, Cal., points out the fact that it is necessary to have every protection possible to prevent the removal of valuable material by thieves. Vaults which are isolated can be easily equipped with a microphone attachment, and a watchman listening at stated intervals should be able to detect any unnatural noises. As an extra precaution, the act of listening could be recorded on a dial which would show the exact time the watchman performed this duty. In most places, a sound like the grating of a drill, while not audible to the ear, would be picked up by the microphone and transmitted to the receiver, even being intensified by the induction coil. The Ericsson transmitter is admirably adapted for the

purpose on account of its extreme sensitiveness and immunity from packing. Many transmitters will work when used frequently, as this serves to agitate the carbon granules, but very few will work after having stood a long time in absolute stillness without first being shaken slightly. This fact leaves the Ericsson in a field by itself for this class of work, and combined with the receiver and other apparatus of equal merit, makes an equipment that can be thoroughly relied on in every instance. Further information concerning this apparatus or anything else in the telephone line can be obtained by writing to the office of the Ericsson Telephone Co., 296 Broadway, New York City, or to their Pacific Coast agents, the Electric, Railway & Manufacturers' Supply Co., 68-72 First St., San Francisco, Cal.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPT. 10, 1901.

682,378.—WATER ELEVATOR.—J. E. Armstrong, Santa Cruz, Cal.
 682,383.—PUMP.—D. Bashore, Walla Walla, Wash.
 682,382.—METALLIC OXIDES.—C. A. Beck, Good Springs, Nev.
 682,452.—RULER.—A. H. Bubher, S. F.
 682,528.—ORE SAMPLER.—A. C. Calkins, Los Angeles, Cal.
 682,530.—BLOWPIPE.—A. C. Calkins, Los Angeles, Cal.
 682,317.—DENTAL ENGINE.—M. N. Callender, S. F.
 682,176.—CAR VENTILATION.—W. T. Cottler, Portland Or.
 682,179.—HASP LOCK.—I. C. Drake, Orling, Wash.
 682,181.—WELL CASING.—Eastwood & Hoagland, S. F.
 682,325.—FOOT REST.—J. C. Garrett, S. F.
 682,463.—FIRE POT.—J. W. Gheen, Portland, Or.
 682,351.—TREADLE.—T. T. Gordon, Juniper, Or.
 682,382.—LIQUID BALANCE.—J. W. Gray, Oakland, Cal.
 682,500.—LAWN SPRINKLER.—T. J. Greer, St. Helena, Cal.
 682,353.—CAR COUPLING.—G. C. Harlin, Stockton, Cal.
 682,562.—FURNACES.—A. Heberer, Berkeley, Cal.
 682,478.—RODDER.—J. Maroff, Tillamook, Or.
 682,478.—DUST EXCLUDER.—J. P. Martin, Ely, Nev.
 682,384.—WRONCH.—J. D. McFarland Jr., S. F.
 682,385.—EXPLOSIVE ENGINE.—J. D. McFarland Jr., S. F.
 682,403.—LEDGER.—A. E. Partridge, Seattle, Wash.
 682,493.—CARRYING CASE.—R. E. Pendleton, Red Bluff, Cal.
 682,578.—VENDING MACHINE.—B. W. Scott, San Jose, Cal.
 682,504.—MUSICAL INSTRUMENT.—E. Strieker, Bisbee, Ariz.
 682,563.—PLOW.—A. B. Strong, Perrydale, Or.
 682,411.—MIXING MACHINE.—W. Sukale, Santa Rosa, Cal.
 682,371.—CONCENTRATOR.—H. P. Taylor, Hailey, Idaho.
 682,577.—HOSE COUPLING.—C. A. Tripp, Los Angeles, Cal.
 682,378.—HANK.—W. Wood, Santa, Cal.
 35,056.—DESIGN.—Tuckey & Kline, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC WATER ELEVATORS.—No. 682,378. Sept. 10, 1901. J. E. Armstrong, Santa Cruz, Cal. The object of this invention is to provide a mechanism by which a small flow of water having a sufficient elevation may be collected into a receiving tank and thence delivered into an endless chain of peculiarly constructed buckets, which chain passing over a drum at the upper end acts to drive a pump which takes its supply from the same receiver and lifts a portion of the water arriving from the same source of supply to an elevation above the receiver and the source.

ENGINE.—No. 682,359. Sept. 10, 1901. W. C. Riley, Lake City, Colo. This invention relates to improvements in engines such as are operated by steam or other propelling medium. It has for its object the furnishing of a compact machine in which a single lever controls the starting, stopping, reversing, or running of the engine at any speed and without the aid of the usual eccentrics or links. It consists of an engine having its cylinders radially disposed in relation to a main power shaft, oscillating inlet valves at the outer ends of these cylinders and a governing device by which said oscillation is effected. There is a controlling valve related to each of said inlet valves, and a means by which said controlling valves are operated in unison.

WRENCHES.—No. 682,384. Sept. 10, 1901. J. D. McFarland Jr., San Francisco, Cal. one-half assigned to John Bruckman of same place. This invention is designed to furnish a device that can be operated in a very limited space and whereby it is not necessary to engage the object to be turned with every rotation of the handle. The device includes a handle having a head provided with a circular opening, a circular jaw mounted in said opening and provided with gear teeth on one of its faces, a shaft parallel with the handle and provided with a bevel gear for engaging the teeth of the jaw, and means for rotating the shaft and continuously operating the jaw without movement of the handle.

ROTARY EXPLOSIVE ENGINES.—No. 682,325. Sept. 10, 1901. J. D. McFarland Jr., San Francisco, Cal., one-half assigned to John Bruckman of same place. This invention is especially designed to allow the use of an explosive gas or vapor in the propulsion of a rotary engine. It comprises a plurality of cylinders having the outer ends connected with the interior of a wheel rim, and the piston rods from the inner ends connecting with a stationary crank or point of support which is out of the center of the wheel, so that impulse delivered through the cylinders and pistons will act to rotate the wheel.

Latest Market Reports.

SAN FRANCISCO, Sept. 18, 1901.

SILVER.—Per oz., Troy: London, 27d (standard ounce, 925 fine); New York, bar silver, 58½c (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £67 13s 9d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots, 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 per ton=2.59 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less 31c; bar tin, 3½c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 ½ flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 ½ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

NICKEL.—New York, 50¢@60¢ ½ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50¢@60¢ ½ lb.

ASSAY LITHARGE.—San Francisco, 10c ½ lb. small lots.

PLATINUM.—San Francisco, crude, \$19 ½ oz.; New York, \$20.50 per Troy oz.

BISMUTH.—New York, ½ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 ½ lb. lots.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9½c ½ set; 14 oz., 40s., 8½c.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 88° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50¢@52½c; cs., 55¢@57½c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 31½¢@32½¢ ½ lb.; carloads, 29¢@30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66¢ B. 2c ½ lb.; soda ash, \$1.90 ½ lb. 100 lbs.; hyposulphite of soda, 21¢@30c ½ lb.; blue vitriol, 5½¢@6½¢ ½ lb.; borax, concentrated, 7¢@8c ½ lb.; chloride of potash, 12¢@13c; roll sulphur, 6c; alum, \$1.90¢@2.00; flour sulphur, French, 2½¢@2½c; California refined, 1½¢@2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3¢@4c ½ lb.; Cal. s. soda, bbls., \$1.00; sks, 95c ½ lb. 100 lbs.; chloride of lime, spot, \$2.50¢@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

"THE DANIEL BEST"

50 Horse Power

TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

### A Point About P & B Ready Roofing==

When the roof of your building is covered with P & B Ready Roofing your roof troubles are over—you need not fear the injurious effects of smokes, gases, rains, extreme heat, extreme cold, fumes, acids or insects, for none of these will interfere in the least with the wearing qualities of P & B Ready Roofing. The roof of your building will not leak, nor crack, nor scale, nor run, nor cost you one bit of expense or annoyance.

P & B Ready Roofing will wear on indefinitely and protect your building as a perfect roofing should.

P & B Ready Roofing comes in rolls, can be cheaply transported and conveniently handled. It is not difficult to lay, for anyone can do it without technical knowledge.

Send for our booklet, giving complete information about P & B Ready Roofing. Address Department A.

PARAFFINE PAINT CO., 116 Battery St., San Francisco.

### The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine.

CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

## CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from  $\frac{1}{4}$  to  $\frac{1}{2}$  greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

## WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Boise ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## ASSESSMENT NOTICES.

**THE CALIFORNIA DREDGING COMPANY.**—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1901, an assessment (No. 2) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin to the secretary of the corporation, at the office of the company, Room 56 120 Sutter Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on MONDAY, the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

**SAM W. CHEYNEY, Secretary.**  
120 Sutter Street, San Francisco, California.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 2) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 221 Crocker Building, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**ALEX. GRANGER, Secretary.**  
Office—Room 221 Crocker Building, San Francisco, California.

**MARINA MARICANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of September, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**GEAS. BOVONE, Secretary.**  
Office—217 Sacramento street, San Francisco, California.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of August, 1901, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**EDWARD H. STERN, Secretary.**  
Office—Room 801 Claus Spreckels Building, San Francisco, California.

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Adams County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of August, 1901, an assessment (No. 12) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**HOLLAND SMITH, Secretary.**  
Office—307 Montgomery street, San Francisco, California.

**YUMA PETROLEUM COMPANY.**—Principal place of business, San Francisco, California. Location of works, Fresno County, California.

Notice is hereby given, that at a meeting of the Directors, held on the 22nd day of August, 1901, an assessment of ten (10) dollars per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, No. 816 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on the 14th day of October, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

**R. F. MALEOD, Secretary.**  
Office—No. 816 California street, San Francisco, California.

**WILLIETTA MINING & MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

**To Secure**  
the best results use our lamps. Both  
quality and price are right.  
**THE COLORADO LAMP CO.,**  
DENVER.

All of our latest improvements are  
embodied in this instrument and it is  
the result of our 18 years' experience in  
building balances.  
Among the noteworthy features in  
the make-up of this balance is the  
improved adjusting device, herewith  
shown.

The adjusting device will appeal to  
the assayer as the simplest and most  
convenient means of checking the  
beam, and consists of a star wheel on a  
threaded arbor, mounted on the center  
edge back of the beam.  
By turning this wheel backward or  
forward, it is moved along the arbor  
and so adjusts the beam to equilib-  
rium.

Telephone, MAIN 5104. ESTABLISHED 1869. A. H. WARD.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the  
**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

SOLAR  
HOUSE  
LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Excels any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known. Write us for particulars.

## WATER PROBLEM SOLVED

We solve your mine pumping problems. Our engineer makes a personal survey of your property. He listens to all your pumping troubles and takes notes of all the things that the old pump won't do. Then we figure on the conditions. Our long experience enables us to arrive at absolutely correct conclusions. We submit plans and cost. If we get the order we build the pump (and install it. If the machine doesn't do the work you don't pay for it, that's all. We guarantee results.

In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co. "We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

## PATENTS

**DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.**

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all.  
Yours respectfully,  
ROBT. WALKER, Superintendent.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt.  
Very truly yours,  
ROANOKE MINING COMPANY.  
Per G. M. WILDE, Acting Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

## Submarine Oil Fields.

To find mineral deposits, that habit of the mind has always associated with the mountains, or at least with the dry land, being commercially exploited under the sea is always a fascinating novelty. It is probable that the Nome placer discoveries, coming when many of the disappointments and hardships of the Klondike were fresh in the public memory, would have received much less attention and fewer people but for the statements that the sands of the Arctic beaches there were profitably gold-bearing. It was reasoned that if the beach contained gold the sea bed must contain more, and the hope of getting it by dredgers and pumps was the basis for the investment of large sums of money in machinery that the physical conditions proved unavailable.

Mines in the sea bottom are not modern. Tin mines in Cornwall, England, many years since commenced to extend their drift workings out under the sea from shafts on the shore. On Lake Superior a silver-copper mine beneath the lake bottom has been mined from a shaft on an island scarcely large enough for the mine buildings. In Japan coal is mined from Takishima and other of the smaller islands—or, rather, islets—far out from under the sea. In all of these instances the visible works are all on the land, the surface of the sea is unfretted with the structures that work out the earth depths beneath the waters.

California, however, has the exceptional instance of sea bottom exploitation where all the structures and mechanical appurtenances of the mining spring from the surface of the sea. The illustration on this page of the Summerland oil field, in Santa Barbara county, is of the derricks, piling, and wharves of this unique and successful commercial exploitation. Some years ago an "oil line," a rock formation yielding petroleum, was traced by producing wells to the sea

The Washington Mining Company's Mill, Bath, Placer County, Cal. (See Page 130.)

shore. Continuing to yield petroleum from the wells at the water's edge just as wells farther inland did, the extension of the formation beneath the sea bed was inferred, and wells were driven from foundations on piling to test the theory. These have multiplied, for the sea was believed to be no man's land, and reclaimable to the extent only that it could be reduced to actual occupancy. The industry illustrated is the result. Within a small area are very many wells, from which oil is pumped up through the sea water and delivered into tanks on shore or afloat at the wharves. The production of the individual wells is

not large—there are no spouting gushers—but the aggregate has made a commercially desirable business.

The place of this unique industry is well named—Summerland. On few shore lines of the open sea—for Summerland is not a land-locked harbor—is the sea so continuously undisturbed and the season so perpetually summer that such operations as are here illustrated could be possible.

The Baku oil fields in Russia, on the shores of the Caspian sea, are very old, but only during the last few years has any study been made looking toward

exploitation of the formation beneath the waters. The Russian Government is now satisfied that the deposits of petroleum extend out beneath the sea and several points have been selected—in depths of water from 14 to 50 feet—where exploitation is being considered. Some practical difficulties are delaying the initiation of work. It appears that the oil from the wells comes up mixed with considerable sand, the separation of which at wells off shore is not yet considered practicable except at an enormous expense involved in building sea-walled enclosures. The idea of pumping sand and oil together to the land through submarine pipe lines under pressure is not mentioned as having been considered. There would seem to be no serious difficulty involved in this method. The Government is preparing to drain Romany lake, in Baku district, so that wells can be sunk in its bed to test the oil-bearing value of the formation before constructing costly reclamation works in the Caspian sea. Precisely why, in such quiet waters as Romany lake must be, the Summerland type of exploitation should not be practicable is not clear. Possibly the reason is that the Russians know nothing about what has been accomplished at Summerland. They should employ American engineers.

The Summerland Oil Field, Santa Barbara County, Cal.

## Low Grade Mines.

Statements concerning the profit earning possibilities of low-grade mines as they are ordinarily given out to, and accepted by the public, are on the whole misleading. Possibly that is the intent with which some are started, but it does not excuse their unreliability, even though it explains the reason for it. The danger consists in the setting up of a false standard of valuation for mines.

The low-grade mine is ordinarily an example used without any qualification, to make a direct comparison with a different kind of a mine. For want of an exact accepted definition, a low-grade mine is loosely taken to mean a mine yielding gross market values of metal as low as the particular example. Gold quartz mines that are made to pay on \$2 ore, quicksilver mines that show a profit on paper with one-third of one per cent quicksilver ore, copper mines that pay more than expenses with three-fourths of one per cent of copper when copper sells at 17 cents a pound, are all popularly considered much the same kind of low-grade mines. In reality they are not at all the same thing. The gold mine that pays with \$2 a ton ore is the true low-grade mine, made by nature an opportunity, and as such improved by man. The quicksilver mine with .33% ore is not a mine at all. It is only near enough to it to be a school from which to get experience at not too high a cost. The  $\frac{1}{3}$ % copper mine as a low-grade mine for profit is a mistake. There may be a profit with copper at 17 cents, but it vanishes with a slight downward change in the market price of the metal. The chance of profit should not be taken.

With the exploitation of low-grade gold mines one must feel the way by trials on successively larger scales. There is no deductive certainty that the experience of exploitation of one mine is going to duplicate itself in another. The only safe way is to be liberal in insisting on a considerable profit margin for a new proposition over that found by experience in the old one. With so-called low-grade mines of other metals it is a question of the maintenance of present metal prices. The permanent tendency of lead, copper and zinc prices is downward. The much greater aggregate of mining operations for these metals has a constant tendency to increase the production of the metal from high-grade ores and to depress the sale price of the metal. The effect is to raise the minimum grade at which the ore can be profitably mined. It is good business to discount this tendency in advance. Big low-grade propositions may figure into metal very fast, but into profits not at all.

The cost of mining and treatment of the unit of

ore is a fairly fixed fact from which to begin estimating. The average metal content of the ore should be able to balance this from sale prices much lower than at present. Here is where a difference may come in between mines. With minable ore bodies of the same magnitude and average metal content, one may have the metal uniformly distributed in the ore, and the others have more or less of its metal concentrated so that it can be mined separately. The latter can stand the lowered values of lower prices by restricting the mining to the portion of the ore body containing the concentrated metal. The first described cannot stand the lowered price, for it must be all minable at a profit or none of it is. It is this kind of a mine that is apt to become a disappointment as an investment for profit from low-grade ores.

## Practical Use of Card Indexing.

Requests come to this journal with increasing frequency asking for suggestion as to a book on this or that special mining or metallurgical subject. Sometimes it is possible to give an answer without a qualification, but more often it is not possible. There are many books on these special subjects of special excellence, yet they fail of meeting the requirement which has prompted the inquiry. The fact is that the practice of mining and metallurgy has become specialized, and has advanced in specialization lines more rapidly than the explanatory and descriptive books have been written and published. The latter are unavoidably more or less behind the most advanced practice. Herein is the qualification that goes with the answer to the inquiry. The book or books are good, are indeed the best or the only publications on the special subject—but they are short at just the point that completeness is desired.

The complete, up to date, information that the inquirer wants, is in most cases to be found in the files of technical journals, the MINING AND SCIENTIFIC PRESS preferably of all that can be suggested, as most completely covering the largest number of the special technical subjects of inquiry. This paper has ever had in view this purpose, and has accomplished during the entire forty-one years of its publication the early presentation to its readers of the useful facts concerning the successive forward steps in every special sub-branch of the arts of mining and metallurgy. That it has been successful in its purpose is due very largely to the unselfish assistance and unflinching courtesy of its readers who have from their own experience and knowledge contributed to this useful record of technical facts.

This journal is constantly in receipt of appreciative comment on its utility to its readers in being the latest and most complete text book in the art. Many readers subscribe for two copies, one being desired for filing complete and the second for clipping on special subjects. A common order is for complete bound files for several years of back numbers, the information on special subjects being that number of years in advance of published text books.

From the testimony of past service, direct and indirect, and all unsolicited, it is strongly advised that the readers of this journal preserve it in complete files. For usefulness for general purposes of reference an index is published at the end of each six-month volume. While there is much cross reference and indexing under several heads it is appreciated that for the service of the specialist this index does not meet the requirements. It is recommended that for this service each specialist prepare a special card index of the matter relating to his specialty. This is a service, that if one would get value received, one must do it for himself from his personal point of view. The specialist's point of view is not academic and recording, but constructive and doing. The way to learn to do something is to do it. Knowledge of what others have done and are doing is the workshop for one's own accomplishment. It is in every instance best constructed as a workshop, when it consists from the beginning of the personal systematization of current and past knowledge.

This card index should be made as the paper is read—complete of each number of this journal as it passes under the eye and through the mind. The indexing is the mental digestive act of assimilating. Be it much or little that appears in any one number of this journal touching the specialty, whatever it is

should be appropriated warm, not warmed over. Possibly it is only a paragraph or a sentence in an article on a subject as a whole not germane, but it should receive its index note just the same. The question of relative proportion in value of the indexed notes comes up for determination later. The advertisements that appear in this journal should not be overlooked. Every special subject has its special operative mechanisms. Knowledge of them is vital from the ultimate commercial resolution of the special subject. A complete card index should include such reference to the trade advertisements of special machines, that the hint to get the advertiser's trade catalogues, which are invariably up to date at one or more points on the subject, is not forgotten.

While the card index for the special mining and metallurgical subjects as here considered has for its base a complete file of this journal, it will suggest itself that it should be inclusive of all publications that come to the specialist's eye. The preservation of the MINING AND SCIENTIFIC PRESS in complete files is advised, because no other single journal will afford as many or as full reference notes, and on many subjects it will contain the majority of all possible references.

On another page are given copies of a few cards, selected at random from more than ten thousand cards of an index, made of California mines by an attorney for service in his professional work.

They will serve to illustrate the method and to demonstrate its business value. The attorney, in any litigation relating to any one of these mines, has at once before him all the published information from which to pick evidence, with the minimum expenditure of labor. The metallurgical chemist specially interested in the cyanide process, should in a similar fashion prepare a special card index of references to the cyanide process. The manager developing a copper mine should have at his service a similarly prepared special card index of references to copper mining and copper metallurgy. Not alone would specialists, by the close touch thus given with everything that has been done, be the better advised as to selection of the best for a particular service; but, knowing all that is known, it becomes much easier to think and reason and discover that which will be new, and may be valuable, from the vast possibilities of the yet unknown.

THE receipt of two inquiries—one from Colorado, another from Oregon—asking if \$50 would be a fair price for a "mining report" or a "mine test" indicates some mental haziness regarding some facts. Cheap and dear are relative terms. Cheapness is usually regulated not by what one pays, but what he gets for what he pays. A mining report may be worth \$50,000 or 50 cents—much depends. A mine test that would cost \$50 would probably be worth that much. One that would cost \$5000 might be the cheaper of the two. It is impossible to give accurate reply to either of the questions. A "mine test" involves so much: the kind of a mine or prospect it is; the cost of getting there; the kind of ore; its extent and value; the amount of development; assaying; treatment of ore; the fee of a competent mining engineer and his assistant; the extent of the required report, that is, how much it shall include. We have seen a mining report, from a man claiming to be a mining engineer, that cost in toto \$25. We have also seen a mining report that cost \$25,000. There are not a few mining engineers who will not take up anything in the way of a mine examination for less than \$1000; there are more who can be had for from \$25 to \$50 per day and expenses. It is not, however, a matter that could be determined by competitive bids. A valuable report is worth all it costs, and in this, as in other things, true economy consists in judicious expenditure. A \$5000 report can be cheaper than one costing \$50. The man making the \$50 report would very probably have honestly earned his money and given value received, but so much more value might be given for the \$5000 report that it would be the cheaper. A report upon which may be based the expenditure of considerable money can not ordinarily be secured for a trifling sum. Better employ a competent man of reputation and experience and pay what such experience and reputation is justified in charging. It would be cheaper in the long run—or the short run.

## Concentrates.

THE Spanish unit of length measure is 32½ inches, the California vara established by statute is 33 3/72 inches or almost one-half inch greater.

THE tin covering of tin plate is from 1½ to 3¼% of the total weight of the plate. A small plant in San Francisco is said to be recovering 2% from tin clippings.

AS A GENERAL RULE, work drill steel at as low a heat as possible and avoid overheating it at any time. Excessive heating abstracts some of the carbon and to that extent impairs the quality.

IT is preferable to lose the cost of dynamite blasting powders that are very old, particularly where there has been much alternate freezing and thawing, rather than accept the risk involved in its use.

THE cost of chlorination treatment of concentrates is from \$8 to \$30 a ton, dependent on quantity and location. With cheap transportation a saving can usually be made by having them smelted at a custom smelter.

THE world's rock-drilling record was made at Spokane, Wash., on Sept. 24th, by Bradshaw and Freethy, the Butte team. Drilling fifteen minutes, they went through 55 inches of granite. For this they won a purse of \$500.

DIAMOND DRILL contractors in the Rand, South Africa, are reported to have contracted to drill holes 4000 feet deep at the rate of \$10.25 a foot, and it is estimated that, with incidental expenses, the cost of sinking would reach \$11 a foot.

A FRESNO, CAL., company has been incorporated to build a 43-mile line of electric railroad in the San Joaquin valley, the idea being to use, electrically transmitted, the cheap water power of the streams in the adjacent Sierra Nevada mountains.

THE gold-bearing ores of the Black Hills have been successfully worked by free-milling, followed by concentration and chlorination, by free-milling followed by cyanide treatment of the tailings, by smelting, and by what is termed pyritic smelting.

A FRENCH COMPANY has been engaged for some years in mining coal on the Island of Saghalien, near the southern end. Russian convict labor is employed. The coal is inferior in quality to the Japanese and the business has not been regarded as very profitable.

THE water of Lake Mono, in Mono county, Cal., is said to contain, in 100 parts by weight, 17.637% of solids. These are: salt 5.854%, potassium chloride 1.581%, calcium chloride 2.630%, magnesium chloride 8.206%, sulphate of calcium 0.402%, and sulphate of magnesium trace.

THE telegraph line has been completed from Quesnelle to Telegraph creek in British Columbia, and on the 24th of September the first message was sent from Vancouver, B. C., to Dawson on the Yukon. The lines from there down the Yukon will shortly put Circle City and Nome, in Alaska, in telegraph communication with the United States.

A MICROSCOPIC SLIDE examination of copper sulphide ores taken out of lodes at about and even below the permanent surface water level shows evidence of secondary enrichment in minute lines of chalcopryite traversing the other mineral, so as to indicate its deposition from solutions flowing through previously opened fracture lines.

CALIFORNIA mining companies very rarely make public either their production or their dividends. Aside from the sentiment that it is not the public's business to know these facts, there is a belief surviving from the early days of California that their publication was an advertisement for the benefit of highwaymen and assessors.

WHILE there is no requirement of the statute making it obligatory to maintain the original location monuments of a mining claim, once they are placed in conformity with the statute, it is a wise precaution to do so. It is a protection against unintentional trespass, and an important matter when the deputy mineral surveyor comes to survey the claim for a patent.

THE Canadian Yukon Gold Commissioner has decided that a hillside claim could be located adjoining a creek claim where the creek bottom is so wide that after allowing 1000 feet width for the creek claim there was still more than 1000 feet before the land rose into hill slopes. The contention of adverse claimants has been that under such topographical conditions the location should be of a bench claim which is allowed only 250 feet of width. This, if sustained, would have given to the contestants 750 feet of the first locator's claims.

A CORPORATION mining in Alaska must appoint a resident agent on whom service can be made in the event of litigation. A statement must be filed with the agent's acceptance of appointment, giving the capital, assets and indebtedness of the corporation. These papers have to be filed in duplicate, one copy with the Secretary of the District and one copy with the Clerk of the District Court. The latter makes no fee charge, the former charges \$10 for filing, but there is no obligation to pay it, as the law makes no provision for filing fees for these papers.

THE Commissioner of the General Land Office at Washington has ruled that mineral claims cannot be filed on Indian allotments of land in the portions of

Indian Territory recently opened to settlement as part of Oklahoma, except by the consent of the allottees, and that the Land Department cannot recognize them even then. The ruling is in effect that the allotment of land to the Indians is a grant without reservations of mineral. The ruling has heretofore been made that Indian reservations outside of Indian Territory are not open to mineral exploration or location of claims.

SUPERHEATED STEAM is saturated or wet steam to which an additional amount of heat has been given. It is a bad conductor of heat and is able to lose a certain amount of heat without becoming wet steam. Superheated steam has a greater volume per unit of weight than saturated steam at the same pressure, which is an advantage which increases with the temperature. Superheated steam engines use on an average 30% to 40% less steam than saturated steam engines of the same type and require correspondingly less boiler capacity. For the same steam consumption the superheated engine is the cheaper.

THE coast prairie, of which the Beaumont oil field is a portion, extends nearly 400 miles from western Louisiana through Texas into Mexico. It is almost a level plain, rising from the Gulf of Mexico inland about 1 foot to the mile. There are slight irregularities or undulations in this plain that from observation and study are supposed to have a definite relation to the occurrence beneath them of oil. The plain is believed to be rising and suffering deformation by folding. The Beaumont discovery is on a dome-like uplift or mound only 10 feet higher than the plain around it. Others have been noted, and the conclusion has been drawn that the oil occurs in underground pools which underlie dome-shaped anticlines in the new made coast prairies.

A STANDARD silver solution can be prepared by weighing out exactly 17.00 gr. of pure silver nitrate and dissolve in 1 litre of water, or weigh out 10.8 gr. of pure silver, dissolve in nitric acid, dry and dilute to 900 cc., neutralize with sodic acid carbonate ( $\text{HNaCO}_3$ ), and then dilute to 1 litre; each of these solutions contains per 1 cubic centimeter 0.0108 gr. of silver, indicating 0.00355 gr. chlorine, or 0.00365 gr. hydrochloric acid, or 0.00585 gr. sodic chloride. To test, weigh out 0.0585 gr. pure salt ( $\text{NaCl}$ ), dissolve in water to which a few drops of neutral chromate of potassium solution is added. With a burette, pass 10 cc. of the silver solution into the solution and it should precipitate out all the chlorine, one drop excess of the silver solution giving a red precipitate.

A LEAKY earth dam should not have its structure disturbed by digging for the leak while the reservoir is full of water behind it. An excellent plan is to dump earth and clay into the water inside of the dam at the point that is leaking. If the leak is not very large or just starting sufficient will be taken into the opening by the water to close it up permanently. If it is clear that the leak cannot be closed by this method, empty it of water by the gates. The level of the water when the leak stops flowing shows the level of its interior start. From a little above this on the inside slope of the dam dig down till well below the line of the leak, stepping down the sides of the trench. Build in this trench a puddle wall, using a thin puddle and building up gradually till the slope of the dam is reached.

WITHIN mechanical and commercial limits, the latter really being the more controlling, the number of revolutions of a hurdy type water wheel shaft can be made to suit the economic conditions of the machinery operated from it. The spouting and impact velocity in feet of the water jet is known from the pressure head in feet of the water. The working rim speed of the water wheel where the jet impinges on the buckets is exactly one-half of the spouting velocity. With this speed fixed, the number of revolutions varies with the circumference of the wheel. To determine the circumference for a desired number of revolutions per minute, multiply one-half the spouting velocity of the jet in feet per second by sixty and divide the product by the number of revolutions. The diameter of the wheel is obtained by dividing the circumference thus obtained by 3.1416.

THE discoverer of a gold placer in Siberia has the right to locate one square verst of surface on discovery. He is not, however, permitted to mine this at once, but must apply to the Governor General at Irkutsk for a survey, for which he must deposit a sum equal to about \$150. This survey is made by a Government mining engineer, and the applicant, who has had the right to prospect meanwhile, must select one-fourth of one square verst from the full area he has located, to which his claim is thereafter limited. When the survey is completed and filed he is granted the right to mine under the supervision of a Government engineer, whom he must pay. It happens, usually, that not less than two years are required between the date of discovery and the granting of the right to mine. An American miner would figure on working the claim out in less time.

THE joining lines between the wood timbers and plank of the outlet gates of the shallow reservoirs, commonly built at the heads of hydraulic pipe lines of placer mines, are made tight by puddling in the clay or dirt so that it settles in compact and tight during construction. The puddle is kept very nearly at the consistency of a thin mud during the building. With this practice it is unusual for leakage to occur. Where concrete, brick or stone masonry is employed for the pipe head works in the earth-built dam of such a reservoir, it is desirable to carry out from the masonry construction core walls of concrete or masonry into the body of the dam at both

sides. These walls should go down to the same solid tight formation as the main structure. In building up they can be stepped back from the foot to a disappearing point at the water level line of the reservoir. Smooth finishing such a wall is to be avoided. It is desirable to have it rough in surface. The earth composing the dam is built up at the ends of the gate structure and along these binding walls by puddling, as described above. The irregularities of surface aid in keeping in place the material once settled. Water channels cannot form along it as along a smooth, straight wall.

THE Trans-Siberian railroad, now well along toward completion, traverses an entirely different section of country from that of the projected Trans-Alaska-Siberian railroad from Dawson, crossing Behring's straits to Irkutsk. The former is built along substantially the line of the Imperial post-road through the center of the line of Russian settlement and on the route of the enormous caravan trade from China overland to Russia. It has provided a better and cheaper facility for a traffic than exists and for people with already established business. The projected road is for the most part through an all but unknown wilderness, without population or traffic except such as the road may itself build up from unknown natural resources. The mines of Alaska are not considered in this, as they have natural transportation facilities so cheap that a railroad cannot displace them.

A CURIOUS phenomenon in connection with the distribution of placer gold has been noticed in Alaska. To some of the lakes in the interior the streams come down with torrential grades. When the warm weather of spring comes, the snow on the mountain slopes begins to melt and the streams to flow before the heavy ice in the lakes breaks up. The water of the streams thus for a greater or less period flows out from the shore on top of the ice and carries with it gold-bearing gravels, which, till the ice melts, remains on top of it. Prospectors panning these gravels have found light gold, which indicated the existence of possible placers in these stream gravels. When the shore ice breaks up and floats away the gravel is transported with it, till the melting of the ice causes it to sink through the lake waters, to become part of what, when the lakes have disappeared, are called by geologists "lake beds." Fine gold so distributed is not at all concentrated, and there can be no bedrock deposits underneath these lake beds. The latter are not known to have been found sufficiently rich in gold to be "pay" for placer mining.

UNITED STATES DEPUTY MINERAL SURVEYORS are not prohibited from making locations of mining claims. They are not prohibited from making mineral entries for patent within the district for which they are appointed; but they cannot in that event act in any other capacity than as claimant. They cannot act as attorney in their own case. They cannot officially survey their own entries. A deputy surveyor may make a location of a claim and make a grant of it to another who can apply for patent and have the official survey made by the locator and grantee. But the locator and grantee cannot make the survey if the grantor holds the title as trustee for the deputy surveyor in order to get the patent. The reason in this is that the law will not make lawful an act done indirectly which could not lawfully be done directly. The Land Department does not make law, nor finally construe it. The statutes do not specifically exclude a deputy mineral surveyor or from the exercise of his right as a citizen to make mining locations. The department which appoints him as a deputy mineral surveyor may and does limit the capacity in which they may appear before the appointing office in any one case.

THERE cannot be two valid lode locations on the same surface at one time. Where the monuments of one claim come inside the boundaries of another, the location first made has the absolute right to the conflicting area. The other claim has the right to the position of its monuments on this conflicting area for the purpose of defining the limits of the claim that are exterior to the conflicting area. It does not seem as if under the statutes it would be possible to maintain title to surface ground which was not based on the actual title to the lode, the claim to which gave the right to claim with it contiguous surface. That is to say, where two claims conflict and the lode line of the junior location enters within, in whole or in part, the conflicting area, which is absolutely part of the senior location, the surface of the junior claim which is contiguous and appurtenant to the lode line within the conflicting area, cannot be held under the junior location. In the case that the lode line of the junior claim is wholly within the conflicting area, it seems clear that the junior claim is void from the beginning, because there could be no discovery within the senior location surface on which a location could be based. Where part only of the lode line is within the conflict, and the discovery is outside of it, the claim to the lode line is only valid for the portion outside. Logically it should only be valid for surface that is contiguous to that outside portion, and the real end line of the junior claim from the point of termination of the lode line is not the boundary line of the senior location, but a line from this point parallel to the end line that is located from the end of the lode line outside of the conflict. The exact point made here does not appear to have been passed on in litigation. The practice of United States deputy mineral surveyors, acting under instructions, has been to so make a new end line in surveys for patents.

## A Laboratory Amalgamating Device.

Written for the MINING AND SCIENTIFIC PRESS by H. S. GUESS.

About three years ago an account was given of a laboratory amalgamating device, together with some data of comparative results. At that time the method had been in use some six months, and the results at that time had been found to satisfactorily accord with those of the mill. Since then, and up to the present, this device has been in regular use, and has in every way fulfilled its early promise of usefulness.

It was thought, therefore, that a short description of it and its work again at this time, together with further comparative data, might prove of some interest.

At the customs milling plant of the Ottawa Gold M. & M. Co., Keewatin, Canada—in connection with which there is a sampling works—free-milling ores are treated in lots of various sizes, and it is optional with the shipper whether he have his ore sampled and purchased on the laboratory determinations of his amalgamable gold, or whether he have it actually run through the mill batteries, and a separate clean-up made, (an extra treatment charge being made in the latter event).

In making the laboratory amalgamation tests on each sample, agitation of the pulp in stoppered bottles with mercury and water was found to be the most rapid and satisfactory. The device itself will readily be understood at a glance from the accompanying illustration. Vertical agitation is given to a little

table running between guides, and on which are clamped the broad-mouthed bottles, the throw being by 2-inch eccentric run at 350 revolutions per minute.

Series of experiments were made, using the same pulps and the same proportion of mercury, but different periods of agitation, to see the time beyond which no further amalgamation would take place. Twenty minutes were found quite sufficient, but in practice thirty are used. The method is briefly thus: The pulp from the sampling works is passed through a screen of the equivalent of the mesh of the mill—usually 40-mesh; from this a portion is taken at 120-mesh, on which from one-half dozen to three dozen assays—depending on the richness and size of the lot—are made to determine the total gold contents: from the 40-mesh portion, from three to ten charges of 100 grammes each are weighed into wide-mouthed glass-stoppered bottles, water and mercury (about ten grammes) added, and the stoppered bottles put on the agitator for about thirty minutes. The contents of each bottle are then panned separately, the mercury panned out and discarded, the sulphide concentrates panned out, dried, weighed to determine percentage and dumped into an assay crucible, the resultant gold being calculated on the basis of the 100 grammes charge of ore, the value per ton of concentrates being obtained by calculation back. The tailings and slimes are evaporated, put through 120-mesh and the assay value determined. The means of the values thus found for the concentrates, and for the tailings, are then taken, and the amalgamable gold determined by difference from the total gold contents value. The comparatively small quantity of

100 grammes taken and doing a sufficient number of "checks," has been found to be more satisfactory than using a larger quantity, as, in the after separation of the mercury, concentrates and tailings, the smaller quantity is susceptible of much more delicate manipulation, and the operation can be carried out with the nicety of a chemical analysis; small, 10-inch diameter aluminum pans with rather steep sides being used for the panning. In order to test the accuracy of the method thoroughly, the different small lots, after being sampled and purchased on the determinations thus made, were stored and run through the mill separately, the bullion assayed by itself and the results compared with the previously determined laboratory results. This proved so satisfactory that after a time the small lots were allowed to accumulate and several run through the mill together. The results were found equally satisfactory, so that the small lots are now all dumped together in the storage bins and no separate clean-ups made.

In the concentration of the sulphides a factor had to be used in determining mill results, as closer concentration could be made in panning in this way in the laboratory than could be done by the mill equipment. The concentrates are, however, in this locality of small account and value.

The method here outlined has enabled the company to handle small ore shipments at a milling rate impossible, were a separate clean-up made, and is valuable as a method of testing laboratory samples to give a close approximation of actual mill results. It is also useful in investigating tailings to see if any amalgamable gold at that mesh is escaping, and is used at this plant for that purpose, as well as for the original determinations of saving.

It finds its best application on free-milling ores with a low percentage of concentrates, and has proven of considerable value to the work here in hand.

Some little experimenting was necessary at first in determining the type of grinding, and the mesh in the laboratory, equivalent to the mesh of the mill with the height of discharge there used; but a series of screen analyses of the pulps from both gave the desired means of adjustment.

Below are given the results on a few of the ore lots which were afterwards checked by separate clean-ups in the mill, some of them being as single lots, and some the contents of a bin made up of several lots in which the proper average of the combined lots had been calculated in the laboratory results:

| Ore lot, No. | Net weight, tons | Laboratory Assay value, \$ per ton | Free gold, \$ per ton | Total free gold, \$ per lot | Mill clean-up | Laboratory variations, % of total value |
|--------------|------------------|------------------------------------|-----------------------|-----------------------------|---------------|-----------------------------------------|

Keewatin, Ontario, Aug. 26.

AN account of his discovery of the new element which he calls victorium has recently been given by Sir William Crookes, F. R. S., to the Royal Society in London. It has a pale brown color, and dissolves easily in acids. Its oxide is less basic than that of yttrium, but more so than the greater part of the earths of the terbium group. The chemical properties of victorium differ in many respects from those of yttrium, but, generally speaking, it may be said to occupy an intermediate position between this element and terbium. It is admitted that the oxide of victorium has the formula  $Ve_2O_3$ ; its atomic weight is not far from 17. The photograph of the spectrum given by the oxide shows certain definite lines which have not been observed with any other body. The spectrum is obtained by the incandescence of the body in a vacuum tube; the light given off has been analyzed by a spectroscopic of great precision, and the exposure upon a photographic plate shows a series of interesting rays in the ultra-violet region. In order to examine the negative an apparatus has been constructed which will measure to the one-hundred-thousandth of an inch.

THE bauxite deposits in Arkansas are, as far as known, confined to a small area lying south and southwest of the city of Little Rock. The region is about 20 miles in length and 5 or 6 miles in breadth, its longer axis extending northeast and southwest. It lies in the eastern part of Pulaski county and the northern part of Saline county. A second district, which is the more important one, occupies the southwestern extremity of the region, embracing about twelve square miles in Bryant township. Between these two sub-districts are several isolated deposits of ore generally without any associate igneous rocks, but so distributed as to connect the main deposits at the extremities of the region.

## The Washington Mine.\*

Written for the MINING AND SCIENTIFIC PRESS.

The Washington quartz mine, at Bath, was the first discovered gold-bearing quartz vein in Placer county, Cal., and is one of the latest to be equipped with a mill and made productive. It is situated in a locality famed even in California for an enormous output of placer gold, and for what is more uncommon still, long-lived placer mines.

The miners of 1849 and 1850 found a little section of the Middle Fork of the American river and Volcano canyon, leading up from the river by the Washington mine, remarkably rich in gold. Tracing upward in the minor side canyons and gulches, the old channels of Forest Hill and Bath were discovered by them, and at or about the same time the Hancock & Watson quartz ledge, now the Washington, was discovered. Later, in Volcano canyon, a number of other ledges were discovered.

The great richness of the placers and the inevitable mistakes with quartz mining in the '50s and early '60s led to the concentration of mining enterprise on the placers exclusively. While the cessation of mining on the quartz ledges was actually due to the mistakes of the mining and to the then superior attractiveness of the adjacent placer mining, the elapsed years of abandonment brought forgetfulness and misunderstanding of these real reasons, and made the local explanation of the neglect the easy one: that there was nothing in the ledges. The present successful operation of the Washington mine is proving that even local opinion can be in error in a declaration as to what is in a quartz ledge.

As a fact, the Washington ledge and other ledges of its immediate vicinity have an intimate connection with the rich mined-out placers of Forest Hill, Bath, Volcano canyon and the Middle Fork of the American river close at hand. The ledges are, in fact, the remnants still in place of the lodes, the erosion of which made the placers. The old Neocene Middle Fork of the American river, which Lindgren has described in his monograph, "Two Neocene Rivers in California," and in the Colfax Folio of the Geologic Survey, and which Ross E. Browne has mapped in the Xth Report of the California State Mineralogist, originally flowed from a location line about where the Middle Fork at Channel Bar now is but 1500 feet over it, northwesterly over what is now Volcano canyon, but in the reverse direction, to Bath, from which point it has been followed by the mining of the Paragon, Mayflower and Dardanelles claims around a great bend which brought the old stream under Forest Hill and nearly to the Middle Fork line again before it turned northwestward in the Dardanelles claim. Under the town of Forest Hill is the remnant of an old stream channel that preceded the Neocene river just described. Its line of flow would seem to have corresponded with the direction of the upper portion of Volcano canyon, that above Bath, crossing transversely, flowing west over the line of the Neocene channel where cut away by Volcano canyon.

The Geological Survey (Placerville and Colfax Folios) maps, show extending from Kelsey, in El Dorado county, to Bath, a belt of serpentines, the direct northward continuation of the mother lode eruptive formation developed in Amador and El Dorado counties. The characteristic Mariposa slates of the mother lode formation, at Kelsey changes from a northward to a northwesterward course. The latter is generally described as the line of the mother lode formations; but it is at least a question whether the mother lode formations do not divide at Kelsey, the eastern fork preserving the general direction of the lode to Volcano canyon and Bath, in Placer county. In Volcano canyon the serpentine formation is in contact on the east with slates and with diorite, the latter in wide dikes along the line of the main contact of the slates and the serpentine and in the serpentine. The west contact of the serpentine is with an amphibolite schist. On both contacts there are strong quartz lodes that are gold bearing, and in the middle of the serpentine is a large vein or altered dike with sharply defined walls, the hanging wall being a diorite dike. This lode is a variety of magnetite, carrying gold, but neither pyrite or quartz. A number of rich pockets have been mined from the surface of these ledges, and the old channel placers at Bath and Forest Hill were noted for the number of large quartz boulders containing gold that were found. The relative situation of the ledges and the placers in the existing stream channels is reasonably conclusive evidence that the placers were derived from the erosion of the lodes from 1000 to 3000 feet—if not, indeed, more—in depth. Over \$20,000,000 of gold are known to have been taken out of placers that must have its original situs in these lodes. Whether or not the remnants of these ledges that are still in place are as rich as the eroded portion must have been, is a question that is at the present time unanswerable.

The Washington ledge, as above stated, was early found to be gold bearing at the surface. It lies on the east side of the serpentine belt at a contact be-

\*See illustration front page.

tween it and a large body of diorite. It is a few hundred feet southwest of the old Neocene channel in the Paragon mine. The hydraulic pit on the rim of the channel contains many large boulders of float quartz from the ledge. The ledge is opened by a tunnel 1400 feet long. At the inner end it is 450 feet below the surface. From Volcano canyon it is practicable, by successive tunnels, to get 1000 feet additional depth, should the final result of exploitation in the upper level justify it. The width of the vein in the tunnel and stipes varies from 2 to 9 feet. The quartz is banded, of the variety known as ribbon rock. It carries visible free gold and high-grade gold-bearing pyrite associated with mariposite, the characteristic mother lode mineral first discovered and named in the mother lode mines in Mariposa county.

At the tunnel entrance is the mill, an illustration of which appears on the front page. It was recently put on the mine, and is the first mill on the ledge, except the small, inefficient affair used in the early '50s to work some of the rich pocket rock at the surface. It has ten stamps, automatic feeders, rock breakers and concentrators, all run by a 35 H. P. boiler and engine. The plant was built by the Union Iron Works of San Francisco. The mine is operated by the Washington Quartz G. M. Co., with H. T. Bells superintendent.

The enterprise is notable to the locality of Forest Hill as the initial enterprise looking to the development of a quartz mining industry. Its continued commercial success is expected to lead to the early development of other quartz properties, long overlooked at Forest Hill and Michigan Bluffs.

#### Existing Industrial Conditions.

Concerning strike conditions on the Pacific coast and elsewhere, in San Francisco the larger establishments, such as the Union Iron Works, the Risdon Iron Works, the Hendy, Vulcan, National Iron Works, and several others, are and have been in practically continuous operation, and while the strike goes on it is but one of the conditions incidental to the carrying on of manufacturing business. There is little activity in strikes north of San Francisco; in Los Angeles there has been no strike this year. East of the Rockies matters in that regard appear to be settling themselves. In Denver the shops are all full at good wages; in New Orleans machinists are working nine hours, being paid from 27½ to 32½ cents per hour, nine hours being a day's work. In Baltimore the nine and one-half hour day prevails at the old rate of pay, namely, \$2 to \$2.75 per day. In Philadelphia, which in some respects is the largest manufacturing city in the United States, there has been no strike. One concern in that city, the Baldwin Locomotive Works, employs nearly 8000 men, nearly all of whom are employed on piece work. The day with them is ten hours, their pay averaging from \$1.25 to \$2.25 per day. The same rule prevails in the big shipyards, Cramps and others, so far as hours and piece work are concerned, but in the shipyards the pay is from \$2 to \$2.50 per day for machinists and from \$2.75 to \$3 for molders. The same general rules prevail in the yards at Newport News and other southern points. In New York city \$2 to \$3 per day is paid for ten hours work. In the marine repair shops the nine-hour day is mostly in force, the pay running from \$2.75 to \$3 per day. The strike there is quiescent.

In sharp distinction to the methods in machine work and similar skilled labor on this coast, is developing specialized work east of the Rockies where regular machinists are largely giving place to men who are put to work at one special machine making special parts, who readily learn how to handle the machines and at the end of two months are receiving from \$1.25 to \$1.75 per day. The president of the Oakland, Cal., Iron Works, who recently made a tour of the principal machine shops of that nature, says that one of these special machines will turn out in a day as much as an ordinary machinist with ordinary tools could in three days, and that in the shops where they are employed 75% of the work is done on them. He instances one shop in Cleveland, Ohio, where he saw a machine of that nature bore 1500 bicycle sprocket wheels in ten hours.

In Buffalo, where considerable of the present agitation originated, the men went back under the old conditions about four months ago on a ten-hour basis, receiving from \$2 to \$2.50 per day. The same general conditions prevail in Cleveland, Ohio, and in Detroit, where there was a big strike, the average pay now being from \$2.25 to \$2.75 per day. In Milwaukee, where there has been a strike similar in cause and effect to that in San Francisco, the men have mostly returned to work on the ten-hour basis, wages there ranging from \$2 to \$2.75 per day. In Chicago the ten-hour day also prevails, the wages being from \$2.25 to \$3 per day. In St. Louis a nine-hour day was conceded with an increase of about 10% in the hourly rate of pay over that previously paid. In St. Paul and Minneapolis there was no strike, the men continuing on the ten-hour day basis at from 25 cents to 27½ cents per hour. In general the rate of wages paid to machinists and shop workers east of the Rockies is notably less than that paid for similar work on this coast.

## Chromite as a Hearth Lining for a Furnace-Smelting Copper Ore.\*

By WILLIAM GLENN.

That basic slag will rapidly destroy ordinary (i. e., siliceous) firebricks is known to every smelter; and the smelter of copper ores in particular knows that any kind of slag occurring in his practice is destructive. From this fact arises the chief distress of those who attempt to smelt copper ores in any manner of furnace constructed of bricks or stone, or other similar material. We have passed the firebrick stage of our experience; and now, having entered upon the period of the water-jacketed cupola, we will employ no furnace other than that having steel walls, kept cool by water.

But, unfortunately, the bottom of a water-jacketed cupola, kept cool by another water jacket, fails of its purpose, being thereby made so cold as to chill both slag and regulus to a degree not bearable. The situation is more or less ameliorated when the upper surface of the water-jacketed bottom is covered with firebricks, since, so long as they last, they prevent the molten material from contact with the cold bottom. My own observation leads me to suppose that most smelters construct cupola bottoms of iron slabs, which are covered, to a greater or less depth, with firebricks. There are cupola bottoms which last no longer than a week; there are others which are said to last several weeks. But the ideal bottom ought to last indefinitely.

The mineral chromite (chrome ore) is not fusible. It is not attacked by the constituents or by any of the fusion products of copper ore. It is worn but slowly by the flowing of dense fluids over it. When heated and cooled, it does not become friable; nor is it subjected to unpleasant explosions when quickly heated to a high degree. Hence, it ought to prove an ideal mineral for the lining of a copper-smelting cupola.

At the Elizabeth mine, in Strafford, Vt., so long ago as 1882, the writer attempted to employ it in a water-jacketed cupola copper furnace, 48 inches in diameter. But the ore used was in the form of sand, and its grains could not be sufficiently cemented. They floated up through the matte and ran with it out of the furnace, bringing about the prompt destruction of a bottom which had been expected to prove extremely durable.

In the summer of 1899 we constructed at the same mine a water-jacketed cupola copper-ore furnace of rectangular form, the hearth of which is 36x120 inches, having fourteen tuyeres of 5-inch clear opening. Its bottom was made of cast iron plates, held up by jackscrews, and protected by a covering 12 inches deep of firebricks. The basic slags, with the matte, would find channels through the firebricks, and thereafter the region of the channels would have to be kept cool by a spray of water until the end of the week, when the time came to renew the bottom. The work had come under the management of James W. Tyson, Jr., who believed he could construct a chrome-ore bottom which would not float in slag or regulus, and would last indefinitely, or, at least, for many months. This paper is intended to recite how he proceeded, and what his results have been.

To contain the chrome ore, and form with it the furnace bottom, he constructed a cast iron basin with surrounding flange, the outer edges of which coincided with the exterior walls of the water jacket. Fig. 1 represents a vertical section, passing through

two of the tuyeres of the water jacket, and through one of the ribs which reinforce the basin. As will be seen, the bottom of the arch is an inverted basin of 36-inch chord and 12-inch versed sine, and 1 inch in thickness (as shown by the dotted line), except the flanges, which are 1½-inch thick. It is in two sections, each of which is 5 feet 7 inches long. Each section is reinforced by three ribs, 1 inch in thickness and depth, as shown in the figure, by means of two of which the sections were bolted together, with an asbestos gasket in the joint. The two outer edges of the basin

were closed by segments, of the form shown by the diagonally-shaded part of the figure, which were cast with the sections. The basin was supported by ten jackscrews (not shown in the figure), placed under its flanges, and thus held securely up against the bottom of the water jackets, leaving free for inspection the entire under side of the basin. The chrome ore was filled into the basin, as shown by diagonal shading in the figure, just filling the basin, and reaching no higher than the bottoms of the four water jackets which form the four walls of the cupola. The ore used was of all sizes, from 10-inch cubes and downward through all dimensions even to dust.

Mr. Tyson says that "the lumps of ore were fitted in as well as possible, the interstices filled with smaller lumps hammered in, and finally the cracks were filled with ground ore." He lays stress on the fact that the ore was well compacted, and that positively no perishable cementing material was employed. Apparently, he lays stress upon having laid a course of firebricks on end over the whole of the chrome-ore hearth, providing a depth of 8 inches of brick to be dissolved before the fused materials could reach it, thus permitting the hearth to heat slowly, and, as he supposes, to "glaze over" before it could in turn be attacked.

The capacity of the furnace is considerably above 150 tons of ore daily; and, with the chrome-ore bottom, it has made a campaign of twenty-three weeks so far. That is to say, it has done well for twenty-three weeks what a firebrick bottom did ill for one week. Its present condition is not known to us, since it has not been seen since the campaign began; and, as "the basin has never been too warm to bear the hand on," we are content to let it continue its good work without interference from us.

Trusting to the continued good character of chromite under the conditions in which it is now serving in the cupola, we are about to erect a blister copper reverberatory, the hearth and adjacent walls of which will be lined with that mineral.

Any adverse criticism relating to the form of the basin herein described, or to the disposition of the chrome ore in it, must be made with a full knowledge of the fact that success—and, probably, eminent success—has attended both constructions. The thing has worked well, beyond any doubt. Nevertheless, I would venture, in the case of another furnace, to alter the construction somewhat, at the risk of making an error. The inner surface of the basin described has a radius of 19.5 inches and a versed sine of 12 inches, affording a space for that depth of ore in the center of the basin. It might be better to make the versed sine 6 inches (which would give a radius of 30 inches for the deeper curve of the basin), and still to lay the chrome ore to a depth of 12 inches in the center of the basin. This construction would give the chrome ore a depth of 6 inches at each side of the basin, and it would reach that distance up into the water jackets. The advisability of this change of construction is almost demonstrable; but this cannot be said for any alteration in the firebrick covering laid over the chrome-ore hearth. What depth of them should be employed, or whether any covering at all is needed, is not now demonstrable. What we do know is that Mr. Tyson laid 8 inches of firebrick over the hearth, and that the latter apparently is as good as it was when the campaign began.

The ore now in the cupola bottom is Turkish, and contains 52% of chromic oxide. There is no apparent reason why 44% ore would not be equally serviceable; and it is more available. Such ores may be had in California and also in the Black Lake region of Quebec.

The chromite cupola bottom above described seems to have suffered no degeneration down to June. It has not been seen by us since the time of its construction, in 1899, because there has been no evidence that any examination was desirable.

Concerning the blister copper furnace mentioned, I desire to say that it was not originally built precisely as above outlined. But later its bridge wall was constructed entirely of chrome ore; and this has suffered no degeneration as yet noticeable. Still later, the slag line of its hearth was built around with chrome ore, and this also has withstood all attacks upon it.

Our experience leads us to believe that the bridge wall of a blister furnace should be lined with blocks of chrome ore, compacted as far as possible, and that the slag line of the furnace hearth should be formed of blocks of chrome ore about 10 inches in height. We would build the larger blocks into the walls, as best we could, and then wedge the smaller ones in among them. The work would appear rude and unskillful when looked upon after completion. Blocks of chrome ore are rough in outline; they do not lend themselves to wall building; and it is a waste of energy to attempt any shaping of them. There is no mortar, wherewith to form an inviting exterior to the work, and there is no other deceitful adjunct present.

But especially at night—when through the charging door one sees the glowing bridge wall as if formed of blocks of snow or piled up white cumulus clouds, and the whitish blocks of chrome ore along the slag line—the structure grows artistic, because beautifully fitting. For no matter what temperature may be attained, or how biting the corrosive and vicious slags may become, yet these chrome ore blocks cannot be

\*Trans. American Inst. Min. Eng., Richmond meeting.

successfully attacked. When the copper has been tapped out of its hearth the furnace may be recharged immediately, while it is hot, and not (as is the case with other linings) after it has grown cold by reason of an interval of three hours, required for repairs.

Writing in "cold blood," and making due allowance for my first enthusiasm, I feel warranted in saying that any copper smelting cupola or blister furnace ought to have a chrome ore lining, as an absolute economic necessity. And I do not see why such a lining would not be the ideal thing for a converter.

### Formulas for Flow of Water in Clean Cast Iron Pipes.\*

I do not pretend to know the history of all the various formulas at present in the possession of the profession, but take it for granted that they are all based on experiments. Experiments to determine the velocity of flow through pipes are beset with many difficulties. In open channels, current meters and floats can be used with very satisfactory results, but this is evidently impossible with pipes, and the only trustworthy method for finding the mean velocity is to measure the discharge and divide it by the area of the pipe. While this may frequently be done with very little trouble in the case of small pipes, the difficulties rapidly augment with the diameters, for obvious reasons. Hence, nearly, if not quite, all of our formulas have been established by observations made on small pipes, and their verification by actual measurement when applied to large diameters is seldom possible. This is unfortunate, because it is precisely for large diameters and heavy deliveries that it is most important to know what can be expected from a given pipe line. Empirical formulas may be safely trusted for values differing but slightly from those for which they have been found to be true; but as the variation increases, the chance of error increases also.

One very serious difficulty attends all such experiments. It is a well-known fact that the nature of the interior surface of a pipe has a very great influence upon the velocity of flow through it. It is hard for any one not familiar with the subject to realize the extent to which this is true. Even those who readily admit the influence which a foul bottom has upon the speed of a vessel going through the water may be unprepared to realize that the same influence obtains when the water goes through the vessel. In the early days of the science of hydraulics water was assumed to be practically a perfect fluid, so that, in passing over the bottom and along the sides of a channel of rough and irregular surface, it would simply level up the irregularities and thus establish an even surface over which to flow. And, indeed, it is probable that this would be to a great extent the fact, were it not for the eddies and counter-currents set up by these irregularities which no doubt exert a retarding influence greater even than that caused by the viscosity of the water. In any experiments, therefore, in order that their results may be applied to practical use, we should know the condition of the interior surface of the pipe experimented upon, and be able to compare it with some fixed standard. It is a common practice to use the term "clean" or "smooth" to indicate such standard of comparison, the standard itself being, however, very vague, though a well-cast pipe thoroughly coated just from the foundry might reasonably be supposed to represent it.

But one important consideration is often lost sight of in this classification. Practically, we are not concerned with a cast iron pipe, but a line of cast-iron pipes. Each pipe may be as clean and smooth as it is possible to turn it out, but there is a joint at every 12 feet, more or less, and innumerable deflections, both horizontal and vertical, from a straight line. If all these changes of direction were accomplished by means of special pipe cast to the proper radius, their effect would be comparatively insignificant; but except in very superior work, or on very pronounced bends, these deflections are overcome by slewing the pipe at the socket for slight variations, and by using cut pipe and sleeves for sharper ones. These causes occasion very serious solutions of continuity in the integrity of the pipe walls, leaving the surface very far from smooth, although it may be perfectly clean. It is this consideration more than any other that gives the deathblow to any possible utility derivable from highly refined pipe formulas. But there are other difficulties which beset the path of the investigator who desires to deduce a general formula from his experimental results, as an illustration will show.

Let us suppose that an experimentalist, whom we will designate as A, has carefully measured the discharge of a line of "clean" 12-inch pipe having a hydraulic grade of 1 per 1000, and from it has deduced the velocity of flow,  $V$ . In the formula,

$$V = C D^x S^y,$$

he now knows  $V$ ,  $D$  and  $S$ , and obviously can vary  $C$ ,  $x$  and  $y$  indefinitely, and quite at will, provided

that each combination gives the correct value of  $V$ .

A second observer, B, has made precisely the same experiment with another "clean" pipe line, same diameter and same slope. He should, of course, get the same value of  $V$ . Equally, of course, and even more so, he does not. He, too, prepares a formula which gives the correct value of his observed velocity, using the same form, but probably a different combination of variables from A. Each observer has a formula which gives with mathematical correctness the velocity of his own pipe line, but would give a wrong result if applied to the other. If, now, a hydraulic engineer, C, wishes to know how many cubic feet per second his proposed 12-inch pipe line will deliver under a fall of 0.001, he can take his choice of either A's or B's formulas, with the almost mathematical certainty that his practical result will differ from both.

But, again, A raises the upper end of his line, so that he now gets a slope of say 5 per 1000, and ascertains, experimentally, the value of  $V$ . He finds that his formula no longer holds good. It evidently is not general, and he must modify it, so that it will embrace both observed results. He can do this by changing all, or any two of the variables,  $C$ ,  $x$ ,  $y$ . This will give him a formula correct for his particular pipe line and for values of  $S$  of 0.001 and 0.005, but not necessarily for intermediate values.

Meanwhile, B has been doing the same with his line, and has also found his formula to be faulty. He modifies it accordingly, but probably differently from A. Here now are two formulas giving not only different values of  $V$ , which is natural, but having also different coefficients and exponents, which is irrational.

Should our two experimenters continue their investigations on other pipe lines, not only of different slopes, but also of different diameters, and progressively change their variables, so as to include each new result, they would continually increase the number of cases for which their formulas held good for their separate pipe lines, and would continually approach each other and the truth, until finally the only significant difference would be in the coefficient  $C$ , which would be the characteristic of their respective lines. I am assuming, of course, that there could be a general formula of the given form. If not only A and B, but the rest of the alphabet also should carry on the same series of experiments not only on so-called clean pipes, but on all the varieties met with in practice, an average value of  $C$  would be found, or rather, and still better, extreme limits would be found between which  $C$  varies with the character of the pipe walls.

Experimental investigation has not yet gone so far as this. Our formulas are based upon a few experiments made on comparatively small diameters, and have been generalized and extended beyond the limits within which observation shows them to be true.

The question then arises, Are there not natural laws which govern the values which can rationally be attributed to  $x$  and  $y$ ? The only influence producing flow in a pipe line is the force of gravity, and the velocity of that flow depends upon the steepness of slope of the hydraulic grade. This velocity must be governed therefore by the law of gravitation, one form of which is  $V = \sqrt{2gh}$ —that is, velocity is proportional to the square root of the height of fall, so that if we quadruple the height, we double the velocity. Are we justified, in view of this fact, in giving any other value to  $y$  than  $\frac{1}{2}$ ? It seems unreasonable to suppose that in rough practice gravity should impart a greater velocity than it does in a laboratory experiment. If there is any difference, one would expect it to be the other way.

Again, it seems to be well established that resistance to flow varies as the square of the velocity, or nearly so. On the other hand, resistance varies as the area of the surfaces in contact, and this varies, in a pipe, as the diameter. Should not the velocity vary, therefore, as the square root of the diameter? In other words, should not  $x$  also equal  $\frac{1}{2}$ ? It certainly appears to me that in a rational formula, based on known natural laws, the velocity of flow should vary as the square roots of  $D$  and  $S$ . If this view is correct, the rational formula would be

$$V = C \sqrt{D S},$$

which is the formula of Chezy, Darcy and others.

It must always be borne in mind by the practical hydraulic engineer that the delivery of water through a "clean" pipe corresponds to the "breaking stress" in a steel girder. No structural engineer would think of using the latter in practice without allowing a large factor of safety. Why should not the hydraulic engineer use the same prudence in his calculations?

### Oregon's First Mining Code.

In 1851 the only mining district known to exist in Oregon was that of the Josephine district. Miners were flocking in from California on the south, and from the Willamette valley and Vancouver on the north. They were congregating at the one gold-bearing locality known—that of Waldo and Althouse, in what is now western Josephine county. There were no existing mining laws in the Oregon Territory code, and accordingly on the first day of April, 1852, on the bank of Canyon creek, a tributary of Rogue

river, forty miners assembled beneath a large fir tree and drafted and adopted the first mining code of the Northwest. The text of the code as adopted read as follows:

Know all men by these presents: That the miners, in council assembled, on this, the first day of April, 1852, do ordain and adopt the following rules and regulations to govern this camp:

Resolved, That 50 cubic yards shall constitute a claim in the bed of the creek, extending to high water on each side.

Resolved, That 40 feet shall constitute a bank or bar claim on the face extending back to the hill or the mountain.

Resolved, That all claims not worked, when workable, after five days, be forfeited or jumpable.

Resolved, That all disputes arising from mining claims shall be settled by arbitration, and the decision shall be final.

Attest:

E. J. NORTHCUTT, Chairman.

### Official Mine History of California.

A large amount of valuable information, particularly relating to the early history of the mines of this State, is buried in the various reports issued by the Federal and State Governments—War Department Reports, Mineral Resources West of the Rocky Mountains, Mint Reports, U. S. Geological Surveys, State Survey and Mineralogist's Reports, Blake's Precious Metals, County Histories, etc.

A card index to this mass of record has been made by Edward Lynch, a mining lawyer of San Francisco. Current newspaper publication concerning the mines not being official or semi-official is only occasionally noted on the cards. The copies of cards following will illustrate the simple system employed in making the index, which has grown to over 10,000 cards and cannot be regarded as complete. The U. S. War Department Reports furnished a number of very interesting and valuable references, though none are noted on the copies below.

The index card on the Empire mine, at Grass Valley, reads as follows:

EMPIRE. Quartz. Gold.

Nevada county. Sec. 35, T. 16 N., R. 8 E., M. D. M.

Ophir Hill, Grass Valley. Located, 1850.

Official survey No. .... Patent date, .....

Raymond's Repts., 1869—p. 26; 1870—pp. 47, 51, 53; 1871—pp. 40, 43; 1873—p. 62; 1874—pp. 117, 128, 129; 1875—pp. 127, 136, 139, 140; 1876—pp. 84, 87, 88.

Mint Repts., 1880—p. 53; 1881—p. 68; 1882—p. 91; 1883—p. 180; 1884—p. 117.

State Mining Bureau Repts., 6th—Part II—p. 46; 8th—p. 426; 10th—p. 371; 11th—p. 272; 12th—189; 13th—242, 252, 270.

U. S. Geo. Survey, 17th Annual Rept., p. 251 et seq.

The index card on the Black Bear mine, in Siskiyou county, reads as follows:

BLACK BEAR. Quartz. Gold.

Siskiyou county. Sec. 13, T. 39 N., R. 12 W., M. D. M.

Black Bear P. O., 8 miles S. of Sawyer's Bar. Located, .....

Official Survey No. .... Patent date, .....

Raymond's Repts., 1875—pp. 165, 166, 167, 168.

Mint Repts., 1880—p. 82; 1881—pp. 100, 102, 103; 1882—p. 125; 1883—pp. 221, 222; 1884—p. 163.

State Mining Bureau Repts., 8th—p. 620; 10th—656; 11th—p. 431; 12th—p. 277; 13th, pp. 389, 434.

### Modern Building Foundations.

The days of the trench digger and the stone mason appear to be passing away. Following the unique concrete piers which have been sunk for the foundations of the new Field building in Chicago, there appears a concrete pile driver, to be used on the foundations of apartment buildings, residences and small stores.

In the old days, when it came to laying the foundation of any ordinary building, shovellers dug deep trenches, and in these the masons set undressed stone, each block in a bed of mortar. This was slow work, but considered sufficient for many, many years. In the modern Field building at Chicago, Ill., workmen dug holes 8 feet in diameter, 90 feet deep. Then in each hole a steel sheath was sunk, and this was filled with grouting. When it hardened it became an everlasting pier. The concrete pile driver works simpler even than this. First workmen skin the ground. The pile driver then is set in motion and bores a hole in the ground to the required depth. The bore is withdrawn and a steel sheath, having a steel core inside of it, is driven by the pile driver to a required depth. Finally the steel core is withdrawn and its place taken with grouting, which, hardening, becomes a permanent foundation.

A foundation of this kind costs a little more than the old style; but the work is done in half the time formerly required, and the permanency secured surpasses that of any ordinary stone foundation ever set. The process is so simple that the wonder must grow as to why use was never made of it before. It saves an immense amount of excavation, upholds a structure by piers of the most permanent kind, and

\* Sherman E. Gould in Engineering News.

prepares the base for use in 50% less time than if stone were used.

The concrete pile is made of taper form and is produced by means of a steel core closely fitted with a shell made of thin steel plate or heavy paper, except wet soil, where it would become moistened, driven in the same manner as wooden piles are forced home in foundation work.

The core is then reduced and withdrawn, leaving the shell in place to maintain the cavity until it is filled with concrete. The pile, however, is not driven to hard pan, as in the case of wooden piles, owing to the friction of the tapered sides against the earth which will hold such an enormous weight that it is unnecessary to go so deep, the taper being calculated according to the character of the soil.

Experiments which have recently been made show that the concrete answers all the requirements of a wooden pile and is less expensive. It was found that at a given blow the penetration of a tapered steel core, 20 feet long, 18 inches in diameter at the butt and 6 inches at the point, was only 1 inch, while that of an oak pile of the same length, 12½ inches at the butt and 10 inches at the point, was 5½ inches.—Cement and Slate.

### No. 2 Universal Milling Machine.

The milling machine herewith illustrated is one of a line of thirteen made by the Kempsmith Mfg. Co. of Milwaukee, Wis., for which Messrs. Parke & Lacy Co. of San Francisco, Cal., are the Pacific coast agents. The manufacturers say that in designing this machine the requirements of tool room and machine shop practice are provided for, and it has ample power, range and variety of spindle and table feeds, with power feed in all directions. The column has a cupboard base with shelves, and the upright spindle bearings are tied together by a bridge cast in one piece with the column. The spindle of forged crucible

### Industrial Combinations Here and Abroad.

The form which industrial combinations take in every country seems to be partly a result of the business habits of the country, partly a result of legislation or lack of legislation.

In practically all places the combinations start by simple agreements among different establishments to sell at a uniform price, or to make no effort to secure the patronage of the customers of one another, or—another manifestation of the same plan—to divide territory among themselves. In most instances, particularly if there are many members of the combination, it will be found that some are not faithfully living up to their agreements, and an effort is then made to secure a firmer union. Wherever the courts will hold an agreement for limiting production or uniform prices legal, the more natural and usual form is for the contracts to be put into writing, with a penalty for breach of contract.

In order to avoid the necessity of litigation it is very common for deposits of securities to be made by each participant of the agreement, with the understanding that if the contract is violated the deposit will be forfeited. If the laws of the country, however, as enforced by the courts, hold such contracts illegal and contrary to public policy, so that they cannot be enforced, the combinations are practically compelled to take some other form, such as that of a single corporation, as in the United States and of late in Great Britain, or else to accomplish the same result in some other way. If the agreement has to do particularly with the regulation of price and is not intended to affect materially the methods of manufacture, it is a common practice in France, in Germany, and in Austria, as well as in other European countries, to organize a selling bureau for all of the establishments, and through the selling bureau, which in itself may be a separate corporation, to determine the extent of the output for each separate establishment and the price that shall be secured for goods. In such cases, of course, the books of the separate members of the combination are open to the selling bureau, and the work of the bureau is open to all of the members, so as to prevent fraud of every kind.

On the continent of Europe it is very generally the case that these combinations regarding prices and output refer only to goods sold within the country, and do not apply to sales for export. It is possible to determine with a reasonable degree of exactness the quantity of goods of any kind that will be consumed at a price remunerative to the combinations within the country itself. That quantity is then fixed and a steady, uniform price for the whole country may practically be established at rates not very oppressive to the consumers, and at the same time profitable to the combination. Any additional spirit of enterprise on the part of any of the members hasto seek its satisfaction in foreign

trade.—From a report by J. W. Jenks, in Cassier's Magazine for October.

### Growth of Railway Traffic.

The growth of railway business in the past ten years, says Bradstreets, is shown by the fact that in the year ending June 30, 1900, the railroads reported that they had carried 1,101,680,238 tons, against 950,763,583 tons in 1899, 897,006,307 tons in 1898, 741,705,946 tons in 1897, 765,891,385 tons in 1896, 696,761,171 tons in 1895 and 638,186,553 tons in 1894, while in 1891 the total tonnage transported was only 675,608,323 tons. Of the total of over 1,101,000,000 tons reported for the year, 957,863,605 tons were classified by commodities, being about 87% of the total. This leaves about 143,816,633 tons unaccounted for as separate commodities. Of the classified tonnage, 546,432,217 tons were reported as originating on the roads which made the reports, while they received 441,431,388 tons from connecting lines. The former figures, increased by a proper proportion of the unclassified tonnage, which would bring the total to about 593,000,000 tons, should, therefore, be accepted as an approximately true measure of the

amount of freight traffic handled by the railroads of the country in 1900-01. Taking, however, the 516,000,000 of tons originating on the reporting roads, the following tabulation exhibits the division of the totals among the different classes of freight:

| Class of Freight.            | Tons.       | Percentage. |
|------------------------------|-------------|-------------|
| Products of agriculture..... | 53,468,496  | 10.35       |
| Products of animals.....     | 14,844,837  | 2.87        |
| Products of mines.....       | 271,602,072 | 52.59       |
| Products of forests.....     | 59,056,421  | 11.61       |
| Manufactures.....            | 69,257,145  | 13.41       |
| Merchandise.....             | 21,974,201  | 4.26        |
| Miscellaneous.....           | 25,239,045  | 4.91        |
| Totals.....                  | 516,432,217 | 100.00      |

The following tabulation presents all the items, amounting to over 10,000,000 tons each:

| Articles.                          | Tonnage originating on roads. |
|------------------------------------|-------------------------------|
| Bituminous coal.....               | 130,443,500                   |
| Anthracite coal.....               | 53,245,195                    |
| Lumber.....                        | 40,977,068                    |
| Ores.....                          | 37,005,530                    |
| Grain.....                         | 28,804,245                    |
| Coke.....                          | 18,917,811                    |
| Sand, stone, etc.....              | 28,445,488                    |
| Merchandise.....                   | 21,972,201                    |
| Iron, pig and bloom.....           | 12,281,361                    |
| Miscellaneous manufactures.....    | 12,583,623                    |
| Miscellaneous forest products..... | 18,678,323                    |
| Cement, brick and lime.....        | 13,429,478                    |
| Bar and sheet metal.....           | 8,144,271                     |
| Live stock.....                    | 8,491,998                     |
| Flour.....                         | 6,088,070                     |
| Castings and machinery.....        | 7,186,880                     |
| Fruits and vegetables.....         | 5,213,210                     |

This confirms the impression as to the preponderance of coal tonnage in the aggregate business of the railroads. Bituminous and anthracite coal, together with coke and ores, amount to over 46% of the total. The actual freight traffic of mineral is, however, a less percentage of the total traffic, the average ton mileage being much less than for other commodities.

### The Jelinek Cage Chairs.

The mechanism of the Jelinek cage chairs is shown in the three accompanying illustrations. Fig. 1 gives

FIG. 1.

a view of the cage bottom with chairs thrown out. It will be noted that springs are not employed in operating the device, but a direct mechanical motion that may be manipulated by a man on the cage, at the landing of any level, at the collar of the shaft, or by the engineer. Fig. 2 shows the position of the chairs after the cage has been landed, the chairs then serving as guide rails and extensions to the track. Fig. 3 is a view of chairs dropping into the shaft as the cage is lifted a few inches before lowering it from a given level. Thus the chairs are thrown out in any one of the four ways designated, but drop inside automatically as the cage is raised above a landing. Old cages may be equipped by ordering new cage bottoms with chairs attached and fitting them in. Hendrie & Bolthoff Manufacturing & Supply Co. of Denver, Colo., state that these chairs are in use at the Iowa mine, near Silverton, Colo., the Golden Cycle at Victor, and the Cook mine at Black Hawk, Colo.

FIG. 2

FIG. 3.

steel is hollow, the front having a B. & S. No. 10 taper hole threaded so that arbors and chucks will interchange with spiral head. The cone pulley has four steps and is strongly back geared. The overhanging arm is provided with a harness to tie it firmly to the knee when heavy cuts are taken. The arm can be removed or turned up out of the way when not in use. The table has quick return of 3 to 1 on same end with slow motion, has three tee slots, an oil pan and channels and can be clamped at any angle. The table swivel block is graduated 50 degrees each way from zero. All movements are indexed to read in thousandths of an inch. The feed is driven by a 1½" belt on five step cones and has twenty changes for every spindle speed, obtained by quick changing self-contained devices. An index plate shows every change from .006" to .126" per revolution of spindle for longitudinal speed. The spiral head can be revolved through an arc of 210°. The spindle of the head is hollow, allowing pieces 1½ inch in diameter to pass clear through. It, as well as the main spindle, has B. & S. No. 10 taper hole. The foot stock has the center placed so that shank or end milling cutters can be used as close to the inner side of center as to the top.

## Mining and Metallurgical Patents.

Patents Issued September 16, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR.—No. 682,371; H. P. Taylor, Hailey, Idaho.

The object of this invention is to provide a device in which is obtained the widest range of position and movement possible for the concentrating table as may be best adapted to the varying kinds and grades of ores under treatment. It is capable of being given a longitudinal, a transverse and a diagonal tilt at one and the same time, or it may be given any of these tilts singly, or it may remain horizontal, and in any of these positions the movement or length of stroke of the table is capable of variation at will. It consists essentially of a horizontally inclined support, a transversely inclined bed upon this support, means by which these inclines may be varied, a shaking table upon this bed, means by which a movement is given to this table oblique to the horizontal line of the support, means by which the length of this movement or stroke may be regulated, and other details of construction.

WATER WHEEL.—No. 682,979; C. F. Du Bois, Denver, Colo.

The wheel having a series of closed cells or buckets in its periphery and outwardly projecting flanges at each side of cell and projecting beyond, a transverse partition in each cell dividing it into front and rear chambers, partitions having radially projecting arms extending through outer walls of cells and loosely connected to flanges beyond cells; with an annular valve band encircling series of cells having ports adapted to register with inlets to either series of chambers in cells while closing inlets of other series of chambers therein, a fixed block having forwardly and rearwardly inclined ports, and an inlet tube for the propelling fluid connected to block and adapted to admit fluid to either.

ALLOY.—No. 682,330; H. Leyendecker, Cologne-Ehrenfeld, Germany.

An alloy composed of lead, copper and antimony containing .1% to .5% of copper and .1% to .3% of antimony.

METHOD OF MAKING CYANIDES.—No. 682,311; S. Zuckerschwerdt, Leopoldshall, Germany.

Making cyanides by heating carbon and an alkali in presence of ammonia, impregnating carbon with al-

kali by steaming coarsely powdered carbon, then boiling it in a suitable liquid and removing gases, and then saturating carbon so treated with a strong solution of alkali with continuous circulation of latter until all water absorbed by carbon is replaced by alkaline lye.

HYDRAULIC AIR COMPRESSOR.—No. 682,811; J. Paterson, Nelson, Canada.

An external tube, 9, provided with an annular series of air-inlet openings, a tapered water-feed tube, 10, secured in tube 9, another tapered tube, 12, secured at its upper end to tube 9 below the openings therein and arranged to extend below tube 10, tube 12 surrounding tube 10 and forming therewith an annular air space which is in communication with openings, and a double-tapered tube, 16, secured at its bellied portion to tube 9 and at its upper end to tube 12, tube 16 arranged in axial alignment with tubes 9, 10, 12, and adapted to receive, above line of its greatest diameter, contents of tube 12.

METHOD OF LEACHING ORES.—No. 682,612; E. L. Godbe, Salt Lake City, Utah.

Disposing moistened ore in superimposed strata within a containing receptacle by a continuous mechanical agitation in the lower portion of latter to form a lower thoroughly agitated stratum of heavier portions of ore, a stratum of lighter portions or particles next above which are agitated to a less degree, a stratum of slimes and other lighter portions next above which remain immobile, and a top covering of a clear supernatant solution, introducing ore below upper surface of latter solution, overflowing and carrying off clear solution, introducing a leaching solution at bottom of containing receptacle below lower stratum of heavier portions of ore and causing leaching solution to filtrate or percolate upwardly through strata above and at same time increasing agitation, and carrying off overflow leaching solution and metal in conjunction for precipitation.

PROCESS OF OBTAINING ZINC SOLUTIONS FREE FROM IRON AND MANGANESE COMPOUNDS.—No. 682,794; F. A. Gasch, Honningen-on-the-Rhine, Germany.

Obtaining zinc solutions free from iron and manganese by treating zinciferous roasted pyrites with concentrated sulphuric acid and roasting product at about a temperature of 400° centigrade, and mixing it while still hot with a suitable oxidizing agent and finally leaching the mixture.

ORE CONCENTRATOR.—No. 682,749; J. G. Roberts, Idaho Springs, Colo.

An endless belt having a concaved, adjustable pulley arranged to support one of its ends and a fixed pulley arranged to support its opposite end, a suitable frame pivotally mounted and arranged and adapted to operatively support belt and its supporting pulleys, means including screws for tilting and adjustably setting frame at any desired transverse inclination to give belt a side or transverse pitch or inclination, means including a screw-controlled pillow block and bearing, and a slotted bracket arranged to support convex pulley for adjustably tightening belt, one or more ore-pulp receiving boxes arranged at higher side of both lower and upper portions of belt, an apron portion on pulp boxes, a series of small pulp discharging holes in boxes above apron arranged to discharge pulp over apron on to belt, means for conveying ore pulp to distributing boxes, a trough arranged along lower side of belt adapted to catch tailings of pulp from belt, a movable adjustable partition in trough arranged to form two or more compartments and to separate and divide pulp into tailings and middlings, a discharge chute below trough, pipes secured to tailings compartments of trough and arranged to discharge into discharge trough, and a pipe leading from each middlings compartment of trough to distributing box of lower portion of belt, and arranged to convey middlings portion of pulp to distributing box, and means including power driven gearing for imparting a slow, longitudinal movement to belt.

DUMPING SKIP.—No. 682,784; T. Bryant, Butte, Mont.

Skip guides provided with recesses, bails provided with shoes secured to and movable on guides, a skip pivoted to bails, shoes rigidly secured to skip and adapted to engage with guides, rollers on skip, tracks adapted to engage rollers when skip shoes are opposite recesses to rotate skip, and links pivoted to skip and engaging with bails to limit rotation of skip.

METHOD OF WELDING METALS.—No. 682,815; B. Purcell, Portageville, Mo.

Sprinkling powdered sulphur into the fire, and subsequently placing the metals in fire and bringing them to a welding heat.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

#### JUNEAU.

It is stated that the wagon road from Snettisham to the Crystal M. Co.'s property has been completed. This property is operated by F. Cook of Juneau. The mill site is graded and ready for the erection of the mill, which will be commenced soon. R. Semple of Sundum will superintend the construction of the mill. There is a large amount of ore on the mine dump.

The 20-stamp mill of the Alaska-Snettisham G. M. Co. of Snettisham has been started up with full ore bins.

#### VALDEZ.

Sundberg & Miller have brought out \$29,000 from the Chetochena river placers for their season's work. Sundberg says larger shipments of gold from the country will be made this year. The country, he claims, has been fairly well developed this season and good results have been found in most instances.

### ARIZONA.

#### GILA COUNTY.

J. H. Johns, vice-president of the Globe-Boston C. Co., from Leavenworth, Kan., has been inspecting the company's property (the Mallory mines), near Globe, with Supt. Whipple. The two compartment shafts on the I. X. L. claim, at a depth of 145 feet, encountered a considerable flow of water and a steam hoist will be installed immediately and sinking resumed.

#### MOHAVE COUNTY.

A silver discovery has been made 275 feet down in the shaft, being sunk by the Philadelphia & Arizona M. Co. to get water for the new mill at the Minnesota mine. The vein averages 5 inches in thickness and assays 350 ounces silver to the ton. The work of construction of the new mill at the Minnesota mine is going on rapidly. The old 10-stamp plant has been removed to the Merrimac mine and added to the 10-stamp mill there. There is also a new steam hoist at the Minnesota to replace the small one now in use on the main shaft.

#### YAVAPAI COUNTY.

Another strike of good ore is reported from the Larramore mine, near Jerome, owned by Hooker & McFarland. The ore carries 15% copper and some gold. The main tunnel is in about 50 feet and a winze from it about 50 feet down. Six men are at present working.

The Lenora M. Co., St. Louis people, is putting up a 2-stamp mill at Hardyville. The company has a bond on the Rattan-Ruth mines in San Francisco mining district and will soon start up the mine, which has a big hoisting plant on a shaft 200 feet deep. The ore is claimed to run high in both gold and silver. Supt. Boyle will make a test as soon as the mill is completed.

### CALIFORNIA.

#### AMADOR COUNTY.

S. K. Thornton, Supt. of the Shenandoah mine, near Plymouth, has bought the hoist at the Tracy mine, near Carson, and he is moving it to the Shenandoah. He states that a shaft is down 500 feet and levels run.

The Buena Vista Copper M. & Red. Co. has been incorporated at Jackson, capital \$200,000, to work ninety-five acres situated in Camp Opra mining district, near Milton. Two shafts were sunk thirty years ago—one of 450 feet, the other about 300 feet. It is claimed that good pay ore was encountered and that the mine was closed owing to the low price of copper in those days. The present company has been organized with E. A. Freeman, L. P. Haney, N. W. Mahaffey, H. J. Parkinson and W. H. Willis as directors.

#### BUTTE COUNTY.

The Gold Bank mine at Forbestown has been closed down. V. Stow of San Francisco is president of the company. H. P. Stow, Supt., states that the mine was closed down because practically worked out as far down as opened. Some men will be kept prospecting by sinking the shaft and extending the tunnel. Some of the miners have talked of trying mining "on tribute," and this may be done. About 100 men will be thrown out of employment.

The Bader mine, near Magalia, will be hydraulicked. B. Mowry, manager, says that the new ditch to bring water is now complete and a debris dam completed. The mine has been worked by drifting.

#### CALAVERAS COUNTY.

A strike has been made on the 700-foot level of the Angels mine at Angels Camp of very rich ore in a wide vein. The ore

shoot is believed to be the same that has been mined in the Utica mine at the 1200-foot level. The mine is owned by J. V. Coleman.

At the Duchess mine, above Vallecito, the tunnel is being driven to tap the ore body at a considerable depth. The building of the mill on the mine is going ahead. T. F. Laird is Supt.

The Lamphear mine, near Mokelumne Hill, owned by Harris & West, has been bonded by an Eastern company, and work will be begun at once.

S. V. Ryland has sold to Woods Bros. a half interest in his Goot Ranch mine, near Copperopolis. Copper, gold and silver are found in the mine, and assays are said to run from \$20 to \$80 per ton. The shaft is now down 100 feet, and hoisting works are being built to carry the work down to the 300-foot level. The owners are considering putting up a smelter later on.

#### EL DORADO COUNTY.

The Zantgraf mine will be opened under the management of D. H. Coles. An Eastern company has bonded the property and Mr. Coles takes charge as their representative. The liens on the mine are to be paid.

#### NEVADA COUNTY.

C. Welsenburger and D. Nivens of Nevada City will erect the machinery on the De Noon drift mine at North Bloomfield. A large boiler, two carloads of rails and a hoisting works have been secured and will be removed to the mine. It will take seventy tons of 30-pound steel rails for the tunnel, which has been started and will be about 5000 feet in length. It will be 8x12 feet in dimensions. The shaft, which will strike the tunnel, is down about 30 feet.

G. A. Nihell of Cisco is pushing construction of the quartz mill on the Hartley ledge at Meadow lake and expects to finish up the building this fall. The mill will be about a mile from the old town at Meadow lake. He has put in a pipe line a mile long to run from the lake to furnish power at the mill.

#### PLACER COUNTY.

The Shady Run M. Co. has been incorporated, capital \$250,000, to mine at Shady Run. The incorporators are L. E. Cross, W. G. Wallace, S. N. Cross, J. Jackson, J. Fisher, C. E. Williams and J. Fyfe, all of Stockton.

The Green Emigrant quartz mine, situated 16 miles southwest of Donner P. O., owned by Gowing, Jacobs & Co., has made a shipment, the second, of fourteen tons of selected ore which assayed \$180 a ton.

#### PLUMAS COUNTY.

It is reported that recent work in the New York mine, near Greenville, has developed an 18-foot ledge going \$6 per ton. Shortage of the water supply in the lakes which supply the Jamison mine, at Johnstown, with power has closed the mill down. The pump is kept running and the mill will be started again after rain comes.

#### SAN BERNARDINO COUNTY.

The Leland and Mitchell group of mines, near Needles, owned by J. H. West and S. A. Bedell, have been sold to T. Ewing for it is reported \$50,000, a portion of the amount being paid down. S. A. Bedell has been appointed Supt. and will start the mines up at once.

#### SHASTA COUNTY.

The Sybil mine at French Gulch is showing up better, reports the owner, G. A. Von Krusze, who says the ore body has been encountered in the lower drift. The ore from the Sybil is shipped to smelters. Some of it goes over \$200 a ton.

The Salt Creek mine, near Keswick, E. P. Conner, owner, is producing steadily and shipping ore every day to the Keswick smelters. Late returns from the shipments show gradually increasing values.

L. Vaughn of Atwater, Merced county, and a Mr. Davis of the same place intend to do development work on a copper claim with a heavy gossan capping, which is on Pitt river below Kosk creek. Mr. Vaughn will be superintendent.

General Manager Cohen of the Bully Hill copper mine at De Lamar has laid off fifty men at the Winthrop mine, near Copper City, which the Bully Hill Co. has been working. The cost of getting the ore to the smelter has been between \$2 and \$3 a ton, which was considered excessive.

The Behr G. & M. Co. has been incorporated, capital \$100,000, to operate the Berr mine in Old Diggings. G. Behr is superintendent, vice J. J. Lawrence, resigned.

A new mining district may be established in the Enchanted Lake region, near the line between Trinity and Shasta counties, west of Sims station. E. Holden of Redding claims to have discovered a ledge of asbestos, and H. White of Delta says that he has discovered extensive iron and gossan cappings in that region. Mr.

White's discovery is but 4 miles from the railroad.

#### SIERRA COUNTY.

R. J. Sharkey, of Sierraville, has interested parties in the Sierra and Nevada quartz claims, at Sierra City. There is a tunnel already in 500 feet which it is intended to continue to the main ledge.

#### SISKIYOU COUNTY.

The Red Lead quartz mine, a new prospect located by J. McGrew and W. H. Cody at Summerville, is making an excellent showing. The owners have a tunnel 110 feet in on the ledge, which is about 3 feet in width and assays from \$25 to \$35 per ton, free milling.

S. A. Conzetti is digging a ditch to get a larger amount of water higher up on his Junction mine, near Cecilville, which will permit operation three months longer every year.

G. Loud, recently from Colorado, has been appointed foreman at the O. & C. mine, near Sawyers. The grading for the new mill is completed. A mile of road from the mill site to the mine is under construction. Mr. Tyrer, the Supt., is also part owner.

W. J. Balfrey, Supt. of the Salmon River Co. at Summerville, says that the company proposes to extend the telephone line from Cecilville to Summerville and to make connections with their other mines near Sawyers Bar. It is probable that the line will be built up to the Cooper mine and later on to the Lawrence and Yellow Rose of Texas mines on Coffee creek in Trinity county.

Work has been started again in the Wolverine quartz mine, near Hornbrook, and a new mill is to be put up. This mine is owned by an Eastern company.

#### TRINITY COUNTY.

O'Keefe & Co., owners of the Fair View quartz mine, near Minersville, have bonded it to J. Porter for the Altoona Quicksilver Co. at \$60,000. The company will prospect and develop the mine and, if satisfactory, the arrastra will be replaced by a stamp mill.

A. Davis of Yreka and Nelson Bros. of Gazelle have located a copper ledge near Trinity Center. The outcrop is 12 feet wide and is easily traceable for 1½ mile. A sample of the ledge assayed \$56 in copper to the ton.

#### TUOLUMNE COUNTY.

The Jumper mine, near Quartz Mountain, is temporarily closed down on account of shortage of water. It is the intention to make repairs and retimber the New Era shaft during the suspension.

The Blue Slate M. & M. Co., recently organized, is operating four claims near Nashton. A crosscut tunnel has been driven through the Pearl and Last Chance veins to the Rising Sun vein. Drifts will be run on the veins and when ore is in sight the company proposes to build a mill. J. R. Ryland of Los Gatos is president of the company, M. Tait vice-president and general manager, J. E. McGlew of San Francisco secretary, and Commercial Bank of Los Gatos treasurer.

At the Densmore mine, Columbia, the mill has been repaired and work resumed with twenty men under Supt. Thorns. The mine is opened by two tunnels, each in 800 feet. The property is owned by Hayward & Lane.

At the Joe Hooker Co. mine, near Soulsbyville, a boiler and pump have been installed to handle the water. The shaft is now down 55 feet. Eight men are at work, with E. A. DeHaven as Supt. The property is bonded to Los Angeles people by P. B. Bacon.

At the Keltz mine, Sonora, ten men are working under Supt. C. Knox. The ditch is being cleaned out and the mine put in shape to commence operations. The mine is worked through tunnels and owned by the Leachman Prospecting Co., P. L. Dunn manager.

W. A. Nevills has become sole owner of the Rawhide and App gold mines in Tuolumne county, buying the stock interest of his former partners, J. Ballard and W. H. Morton, on the basis of \$1,500,000.

Work has been started on the Garibaldi, on Bull creek, near Groveland, and the mine cleared of water.

#### YUBA COUNTY.

The California G. & C. Co.'s mine, near Spenceville, in which C. C. Bitner is interested, has been bonded to Idaho people, who are working the mine. Mr. Bitner is president and general manager, M. H. Jackson secretary and T. H. Thomas treasurer.

#### COLORADO.

#### CHAFFEE COUNTY.

The Tasmania C. M. & M. Co. owns between 400 and 500 acres of ground near Winfield. This company is at present driving tunnels in several claims and taking out some high-grade copper, lead and silver ore. The Tasmania Co. has a 30-ton pyritic smelting plant, which it anticipates increasing in capacity by eighty tons.

#### CLEAR CREEK COUNTY.

The Lamartine mine is claimed to be producing about \$10,000 a month from development work. It is owned by F. E. Himrod of New York. An electric railroad is projected to be built to the mine when sufficient development work is done.

A strike has been made at Georgetown, in the Burleigh tunnel on the Seven-Thirty vein, at a depth of 1400 feet from the surface, a large body of high-grade ore being opened at the point of intersection, 2700 feet from the tunnel entrance. It is understood that the streak of solid ore is several inches wide and will carry about 300 ounces silver per ton. There is 1000 feet of virgin and undeveloped ground above, and a similar streak of high-grade ore has been mined from the 400-foot level to the surface, the ore chute opened there being several hundred feet long.

#### PITKIN COUNTY.

(Special Correspondence).—The Mollie Gibson and Argentum-Juniata concentrating mills are operating under W. J. Cox as manager, with A. G. McClymonds in direct charge. The Mollie Gibson handles about ninety-five tons of ore per day, the Argentum-Juniata running about 115 tons daily. Both mills, which are under the same roof, operate with crushers, Huntington grinders, classifiers and Frue vanners, there being no jigs. The Argentum-Juniata produces almost strictly a silver ore, that from the Mollie Gibson being silver-lead. The gangue of both ores consists of lime and baryta, with little silica. In some of the ores the baryta carries some silver, in others it is nearly valueless. In the Mollie Gibson ores the lead carries most of the silver and the barren spar is eliminated as nearly as possible by the concentration. The Argentum-Juniata ores carry a larger percentage of lime than is found in those of Mollie Gibson, but less spar. In this case the lime is concentrated out as fully as possible, and the spar, which is in combination with silver, is retained. Neither Argentum-Juniata nor Mollie Gibson ores are lime ores in the sense that the ores are that come from Aspen mountain, on the opposite side of the river. The lime in the former does not exceed 7% or 8%, which is not taken into account by the smelters; but those from Aspen mountain that run high in lime command a premium at the smelters on that account. Mollie Gibson mill concentrates about seven tons to one ton. Both mill forces are made up of three eight-hour shifts.

Aspen, Sept. 12.

#### SAGUACHE COUNTY.

The Philadelphia owners of the Independence mine at Crestone, it is reported, have decided to sink a three-compartment shaft 800 feet, with levels along the vein at every 100-foot station.

#### SAN JUAN COUNTY.

(Special Correspondence).—There is more than the usual degree of activity on Sultan mountain. The town of Silverton is located on a flat at the northern base of this mountain. The principal mine here is that of the Hercules M. Co., a close corporation, Manager T. H. Kane being one of the owners. The mine is opened and developed through three tunnels that crosscut four veins. The Empire, which is the lowest, goes in 2400 feet. The Boston, 275 feet higher than the Empire, cuts 1800 feet in the same direction. The highest is 475 feet above the Boston and goes in 900 feet. All the tunnels are 7x8 feet and are all connected. There are 5700 feet of drifting on the strike of the various veins. It is estimated that the veins are an average width of 2½ feet. The work is done by air drills, operated by a Rand compressor. The ore is a lead, iron and copper sulphide, carrying gold, silver and lead values. It is delivered to the concentrating mill by short surface tram lines. The mill is operated by water power, has thirty stamps, jigs, plates, and Wilfley tables. About 110 tons of ore are milled daily, that tonnage being reduced to about thirty tons of jig and table concentrate. The jigs make a heavy lead product and another grade that carries most of the iron and copper. The jig tailings are elevated and fed to the stamps, the material passing over the plates, thence to the tables.

Joining the Hercules on the south is Champion No. 1, also on Sultan mountain. A 175-foot crosscut tunnel opened a vein, 36 inches wide, of solid copper sulphide, running \$75 to \$100 per ton in silver, gold and copper. Drifting on the vein is going on and some shipments are being made to the Kendrick smelter.

Adjoining this group on the south is Champion No. 2, belonging to the Nodaway Co., whose work has uncovered the same kind of ore.

Lying just north of the Hercules is the old North Star of Sultan mountain, which is not the same North Star as is mentioned in previous correspondence as being located on King Solomon mountain. Through the efforts of Thos. Keely of

Denver all the old interests were acquired by a new company composed of Chicago parties, who intend to put the mine in proper condition and resume operations. Their superintendent, H. Starkweather, is on the ground to carry forward the work.

Silverton, Sept. 7.

#### SAN MIGUEL COUNTY.

(Special Correspondence).—The Carribeau, at Ophir, is mining and milling about twenty-five tons of ore per day. The product is an iron and lead concentrate that carries gold, silver and lead values.

The San Bernardo M. Co. of Colorado Springs and Cripple Creek are operating their mine which is on the San Bernardo spur of Mt. Wilson. The work is under the management of W. D. Blackmer. The mine is opened through a series of tunnels that go in on the vein. The ores carry silver, gold and lead. The property includes a mill which is operating with crusher, rolls, jigs and tables. It operates on about fifty tons of ore per day. Some of the higher grades are shipped direct.

San Bernardo, Sept. 2.

(Special Correspondence).—The Andrus group of three claims, located in Ingram basin, belonging to Geo. Rohwer and others, has been bonded to the Four Metals Co., of which J. H. Shockley is manager. It is understood the latter will do \$1000 worth of work per month on the group from now on. This basin is about 3000 feet higher in elevation than Pandora, and is mineralized by several parallel veins that carry a lead and copper sulphide ore. Besides developing underground the company will erect some necessary buildings. A considerable amount of other work is being done in this basin, where eighteen claims have been patented this season. One car of ore was shipped from the Black Bear group recently.

Telluride, Sept. 13.

#### SUMMIT COUNTY.

On Little Mountain, at Breckenridge, J. B. Conrad and R. W. Foote are doing development work, sinking on the eastern slope of the hill. Later on a drift will be driven to the vein, from which, near the surface, they have made several shipments of a high-grade silver and gold ore that also ran well in lead.

During the recent development work on the Jessie mine, in Gold Run, under both company management and on the Whitehead lease, between 2000 and 3000 tons of mill ore has been accumulated, which will be run through the mill under company operation. The underground work is in charge of H. Whitehead.

The construction of the new plant of the Robinson Con. M. & S. Co. is well under way. This company has bought the old Robinson mine and smelter, at Robinson, to treat the low-grade ores left in the old works in the mine, which could not be profitably taken out and transported to Leadville or Denver. Three furnaces are being installed, with a total capacity of 300 tons. The stack will be 150 feet high, with a flue chamber of 100 feet. The old smelting works will be used for ore bins, while the building enclosing the smelter proper will be entirely new, the boiler and engine room being 150x70 feet and the furnace room 85x116 feet. The carpenter and brick work is in charge of J. L. & L. W. Murphey, who built the Home pyritic plant at Ouray. Brick yards have been established at Robinson; 150,000 bricks have already been burned and 100,000 more are ready for the kiln. The smelter will be connected with the Rio Grande road, the rails passing completely through the plant, so that ore and fuel can be handled with the greatest economy.

#### TELLER COUNTY.

"I believe the average royalty should not be over 10%," says a large owner of Cripple Creek claims. "In some cases 15%, with the maximum not over 25%. These lower rates of royalty should induce many lessees to take up outside ground and work it for a period of from two to five years. Two years ought to be given on every lease, and five on the hard propositions outside the producing area. It has been practically demonstrated that the work cannot be done at a profit to the lessee under the present terms. There is scarcely a company in the district that is making over 25% or 30% royalty—that is, paying over that amount in dividends. Some of the best producers in Cripple Creek pay about 25%, 30%, 18% and 20% dividends. Royalty terms should be pounded down generally to an average of 10%, in order to give the lessee an incentive to put his money into outside development and investments, and the camp will benefit more by that than by any other method in encouraging the small operator. If a good body of ore is opened by the lessee, it will not be a very good property in any event if it plays out before the company gets a chance at it on

its own account. The result of reducing the royalty and increasing the period of time given to the lessee to work, will be of untold advantage to the camp in widening the productive area and opening up new fields. Leasing has always flourished in the district on account of the excellent chances of opening up a very rich deposit that will make a fortune for the miner who is putting every available cent of his own money into the proposition."

The capacity of the mill now being erected by the Portland G. M. Co. will, it is said, be doubled as soon as the machinery is finished and tested. The capacity of the mill now under way will be 300 tons of ore per day, and when doubled will be 600 tons of ore, nearly 19,000 tons monthly. The Portland mine production for September will, it is stated, be close to 9000 tons of ore of all grades.

Big shafts and prospect holes to the number of 100 or more on the properties of W. S. Stratton, in Cripple Creek district, are being filled up with mine refuse and wash. Many finely timbered shafts are being filled the same as the smaller ones. The old shaft houses and machinery will also go, and soon portions of the hills, aside from some of the dumps, will assume the appearance they had before the prospector's appearance. One purpose of the work is to prevent the possibility of entrance to many of the big properties, which are in the course of extensive development at great depth. Stratton's property on the surface extends from Independence to Cripple Creek. The same condition also applies in a measure to his long underground workings. Entering one property, several may be walked through for a mile or farther in several localities, and these distances are being steadily increased. With the numerous and unguarded old openings it would be possible to enter unobserved, commit mischief or theft and escape with the least possibility of detection. There is some ore in a few of Stratton's mines the pounds of which are valued in dollars. Great shafts are being sunk by Stratton on the American Eagles, John A. Logan, Hidden Treasure, Plymouth Rock and other properties that include several full claims, and at extreme depth long drifts are opening the veins. Three years, it is calculated, will have been occupied in the development of Stratton's acreage before it is ready for exploitation.

The Doctor-Jack Pot water column pipe installed in the mine is 10 inches in diameter and is the largest one in Cripple Creek district. The pump is intended to lift 2000 gallons of water per minute and a larger amount if necessary. The flow is now 1800 gallons. It is expected that the work of pumping out the lower levels will be completed before the end of the month.

The pumps have been pulled from the lower workings of the Eclipse Con. mine at Victor and the water allowed to rise while outside improvements are being made. The property is equipped with machinery not considered adequate for the underground work soon to be undertaken. The additional equipment will consist of three boilers and a compressor capable of driving six machine drills. The shaft now down 400 feet will be sunk 600 feet.

Symes, Delaney & Sims are developing a shoot in the Atlanta at Cripple Creek, which they followed in from the Deadwood No. 3 on the 250-foot level. The shoot measures from 14 to 24 inches in width and a return from the initial shipment showed values of \$33 in gold to the ton, without sorting.

#### IDAHO.

##### ADA COUNTY.

W. A. Magee of Pittsburg, Pa., is preparing to put up a 10-stamp mill on the Delhi mine, on Shaw's mountain, 8½ miles from Boise. He has been developing the mine for two years.

##### BLAINE COUNTY.

The new 1100-foot wire cable of the Tip-top mine, near Hailey, has been put in place in the shaft, and sinking will be resumed toward a depth of 1000 feet. The latest development is a body of ore on the 700-foot level that is 14 feet in width and assays very high in gold.

##### ELMORE COUNTY.

F. J. Conroy, manager of the Monarch, Buffalo and Last Chance mines, at Atlanta, states that the shaft on the Monarch mine is now undergoing repairs, and the water is being pumped out, so as to work the Monarch, Last Chance, Pomeroy and Buffalo mines through it. The tunnels leading to the shaft are being cleaned out and bodies of ore in sight will be taken out and milled.—The Big Lode mill, under the management of C. F. Lange, is being rebuilt. The old concentrators have been taken out and replaced by 6-foot vaners, which will have a capacity of handling sixty tons daily.

C. W. Purcell of Washington, O., says of his company's placer ground on the

south fork of the Boise river that the drilling machine installed for the purpose of finding the old channel of the river has been operating steadily on their ground, but has not yet discovered the pay channel. He says that operations will continue all this year at least.

The Golden Age Co. has made the first payment on the Tahoma property, at Atlanta, and F. Willis, as superintendent, has taken charge. It is believed that the mill will be enlarged and twenty additional stamps put in.

#### IDAHO COUNTY.

F. Brown, superintendent of the Jumbo mine, at Buffalo Hump, reports the second run of fifty-five tons of ore as yielding on the plates \$1380, or \$25 a ton. The ore concentrates twenty tons into one, showing a value in concentrates of \$325 per ton, or from the ore of \$16 a ton. The Jumbo vein runs from 4 to 16 feet in width. They are now impounding the tailings.

#### LEMHI COUNTY.

A strike has been made on the Golden Gate mine, on Wallace creek, near Salmon City. The mine was located upon rich gold quartz float, of which about 100 tons have been collected, showing coarse gold in nuggets often as large as grains of wheat. In a 60-foot tunnel, with 40 feet of depth, running through granite, the miners broke into a fine shoot of ore, showing coarse gold similar to the float.

#### OWYHEE COUNTY.

On the Banner mine at Silver City in drifting on the 8-foot ledge good ore has been found. The Banner is the central one of a group of claims on two parallel veins.

#### MICHIGAN.

##### HOUGHTON COUNTY.

The Mohawk M. Co., it is stated, has arranged with M. Guggenheim's Sons to construct a special smelter for the reduction of the mohawkite ore. The smelter is being constructed at Hackensack Meadows, N. J., and the arsenic will be recovered by passing the fumes through a series of vaulted brick chambers, on the walls of which the arsenic trioxide will crystallize, and from which it will be scraped by workmen wearing respiratory masks. The contract made is for three years from the completion of the smelter, calling for the supply of a minimum of 100 tons of mohawkite monthly. The smelter is to treat about seven tons daily. Several hundred tons of the mineral are now barreled at the mine, awaiting the completion of the smelter, which should be in operation in September. The smelting people have agreed to save the copper and a reasonable percentage of the arsenic contained in the mohawkite ore. The silver can also be parted from the copper by electrolytic treatment, but the antimony and cobalt are figured as wasted. Whether the nickel will be saved or not depends upon the percentage of that metal and the difficulties met with in separating it from the numerous other elements in the ore. The value of the copper contained in the mohawkite is very nearly \$200 per ton on the average.

#### MONTANA.

##### FERGUS COUNTY.

A. Hibbard, of Maiden, says the stamp mill belonging to the Missouri Peak G. M. Co. is in operation at Landusky, and that Lortman & Putnam's cyanide plant is being constructed on the southeast side of the Little Rockies, but otherwise there is little doing in the district.

On the Abbey mine, North Moccasin district, which has been bonded by J. R. Cook, of Spokane, who is superintending, the ground is being developed and ore has been found in both the tunnel and the shaft. Ten men are employed.

##### JEFFERSON COUNTY.

The Peck-Montana mill, between Helena and East Helena, is to treat tailings from the Old Comet mill, about 6 miles northwest of Boulder. Wagon haulage to the railroad was found too expensive, and the original cost of a steam tramway was too great. The operation is by the Helena & Livingston S. & Red. Co., and they are using a road engine which hauls three large ore wagons with a capacity of sixteen tons each. The train makes two trips a day, transporting about 100 tons per day. The engine, which was brought from Emigrant Gap, Cal., where it had been used hauling lumber, weighs fifteen tons and has tires 26 inches wide, and the wagons have 10-inch tires. The tailings are loaded into the wagon by a 22-ton steam shovel.

##### LEWIS AND CLARKE COUNTY.

F. Farmer and F. Moratt, of Helena, have sold to J. Lindt, of Council Bluffs, Iowa, for \$2000, the Elizabeth mining claim, in the Scratch Gravel (unorganized) district.

A hoist is being erected by O. A. Southmayd, of Helena, W. B. George and other Billings people on the Levi Blossom mine,

near Helena, and is expected to be in operation soon. The shaft will be sunk to the 200-foot level and a pump will be installed. The mine produced much ore of good value many years ago.

The 10-stamp mill on the Orphan Boy mine, near Winston, has been sold by Wood & Esler to the D. & C. M. Co., which has removed it to its mine on Dry gulch, near Helena, and has it in operation. A shaft is down 103 feet on the lead and sinking continues. The ore milled yields good values and the lead improves with depth.

#### MADISON COUNTY.

M. B. Davis, manager of the Alder Gulch M. & M. Co., has begun work on the concentrator and cyanide plant for the Bell and Grand Union properties, near Virginia. The building will be 140x40 feet, with a wing 20x20 feet, for the engine and boiler. The cyanide room will be 40x100 feet. The plant will be a 40-ton Huntington concentrator.

#### SILVER BOW COUNTY.

The sliding movement which has been damaging buildings and other property in different parts of Butte for several years has made it necessary to close the Never Sweat mine, the largest of the Anaconda properties. It has been stated that the deep shaft of the mine is 7 inches out of plumb, and the foundation of the engines has been so displaced that it has become unsafe to work the engines. The foundation will have to be rebuilt and the mine will remain closed for some time. Anaconda hill, as well as the hill upon which the city is built, has given frequent evidence of the movement of the earth, but the movement has been slight and gradual.

#### NEVADA.

##### ELKO COUNTY.

W. D. Higginbotham, manager of the White Rocks Co.'s placers out of Elko, says he is now putting in flumes, and with the plant equipment completed he expects to begin the washing of gravel before winter.

It is reported that below the 250-foot level at the Dexter M. Co.'s mine at Tuscarora, ore has been found which yields over \$600 per ton in gold and silver.

#### LINCOLN COUNTY.

J. Healey, general manager of the April Fool of De Lamar, discussing De Lamar and its mines, says that since the reduction of the forces at the De Lamar mine the camp has become short of miners. While preparing to install Chilean crushers and remodel the plant according to plans made by Cohen & Janney, there are about fifty miners employed at the De Lamar mine. With the alterations on the mill completed, it is understood that the leaching of a large amount of surface ore carrying about \$5 in gold is to be treated in connection with the output from the Hog Pen shoot. At the April Fool the sulphides have been struck at a depth of 1300 feet, the ore showing a very satisfactory average.

At the Magnolia a few men are cleaning up and preparing for work.

J. A. Miner of Salt Lake City, who lately visited Tonopah with J. F. Anderson and J. H. Jenkins of Philadelphia and of the Tonopah M. Co., in speaking of his visit, states that at Tonopah, within an area of 2000 feet square, are fifteen well-defined ledges, 6 inches to 10 feet in width, with ore being taken out. The average assay value of all ore shipped to date he states as over \$200 per ton. Ore to the gross value of \$216,000 had been shipped from Feb. 16th to Sept. 13th, with 650 tons sacked ready for shipment on Sept. 18th. A 100-stamp mill is to be put in next spring. It is 60 miles to a railroad and twenty-six wagons, drawn by from twelve to twenty animals each, are used to haul the ore, nine tons being a load. The promoters are now working to get a branch railroad to Tonopah next year. To date 114 leases have been let, about seventy-five of which are being worked.

##### NYE COUNTY.

(Special Correspondence).—In a rock drilling contest here to-day Hurley & Saulsbury won, driving the drill through 40½ inches granite in fifteen minutes; Kendall & McAuliffe, second, 35 inches.

Tonopah, Sept. 17.

#### NEW MEXICO.

##### GRANT COUNTY.

The new breaker and switcher being put in by the Colorado Fuel & Iron Co. at Union Hill have been completed, doubling the shipping capacity. Other improvements are projected by the company.

The strike on the El Oro at Hillsboro, owned by W. H. Andrews of Pennsylvania, is said to have the appearance of a placer 300 feet below the surface. The company is sinking 100 feet deeper. The production of the mine is reported in excess of the mill capacity.

A strike has been made in the El Oro

mine at Andrews, operated by the Philadelphia M. & M. Co. On the 300-foot level an ore body, from 2 feet to 16 feet wide, has been opened, assaying from \$8 to \$138 gold per ton. One man is said to be breaking ore sufficient to supply the mill.

## SANTA FE COUNTY.

J. H. Hemler of Cleveland, Ohio, has bought the Lone Star mine, in the Macho district, 14 miles from Santa Fe. The Lone Star belongs to a group of claims owned by F. Malluchet. Mr. Hemler represents Cleveland and Youngstown, Ohio, capitalists. A contract has been let by him for 100 feet of shaft work, and operations will begin immediately.

## TAOS COUNTY.

L. T. Bryan has started work on the Gold Mint mine at Red River, owned by the Gold Mint M. & M. Co. Development work shows a 4-foot vein, assaying up to \$100 in gold per ton.

## VALENCIA COUNTY.

The Zuni Mountain Co. has been incorporated by C. L. Seagraves and W. J. Black of Topeka, Kan.; H. M. Walt of Newton, Kan.; D. B. Burger and W. J. Skeed of Grants, N. M., with capital \$100,000, to engage in mining in the Zuni mountains. The office of the company will be at East Las Vegas.

## OREGON.

## BAKER COUNTY.

P. Campbell of New York, who recently bonded the Flagstaff mine in the Virtue district for \$120,000, has taken up his bond and will soon start work on the property.

The transfer of the Gold Bug and Friday mines from Mahoney & McCarthy to F. Wilson of Salt Lake City, Utah, has also been completed. The price was about \$10,000. Mr. Wilson has placed a 5-stamp mill on the Friday and will push development work. The ore is free milling and runs about \$14 per ton.

## DOUGLAS COUNTY.

E. S. Snelling and A. W. Anthony of Portland and T. Carroll and F. Eidemiller of Tacoma, Wash., have arranged to consolidate the J. S. Savely mine, the High Bench mines and the Goodnough placer mine into one company. The agreement provides for funds sufficient to put in operation five additional plants to the one now in operation. The new company includes G. J. Cole of Farmington, Mo.

## GRANT COUNTY.

The Prairie Diggings quartz mine, near Canyon City, has been sold for \$60,000 to E. J. Foster and W. F. Shaler of Grass Valley, Mich.; M. D. Winder of Spokane and I. B. Hammond of Portland. There are five claims in the group and a water power. The ledge, which is very wide, gives, it is claimed, an average assay of \$8. The ore was run through a 5-stamp mill and produced from \$2500 to \$3000 per month.

The Phoenix mine of two claims, in the Greenhorn district, has been bonded by C. C. Nepple of Baker City at about \$80,000. The ledge has been opened by three tunnels, which are in 700, 300 and 200 feet, respectively, and by two shafts. The ore ledge is from 6 to 7 feet wide and on the lower levels the values are claimed to run from \$70 to \$100 to the ton. A new 20-stamp mill is ordered.

## JACKSON COUNTY.

Returns received from the smelter for a shipment of ore made from the Ray mine, near Gold Hill, show assay values \$49.30 silver and \$7856 gold to the ton. The mine is owned by E. Ray, who took out \$4000 three years ago at a depth of about 150 feet. He leased it to G. H. McDonald and J. Miller of Gold Hill, who continued sinking, and at 175 feet found the rich rock of the shipment mentioned. The lessees also hold an option for its purchase at \$4500.

## SOUTH DAKOTA.

## LAWRENCE COUNTY.

The Hidden Fortune Co. of Denver, Colo., in its shaft near Lead, is getting into a solid ledge of free-milling ore, which assays about \$15 gold per ton.

## UTAH.

## BOX ELDER COUNTY.

The Chester No. 1 and No. 2 mining claims at Park valley have been bought by W. H. Edwards and G. N. Warmick of Salt Lake City, and the former will be in charge of work that is being started.

Supt. Joseph of the West Century, in Park valley, says a strike has been made in that mine. Samples assay \$118 gold, twelve ounces silver and 19.4% lead, the ore coming from a 6-foot quartz ledge.

## SUMMIT COUNTY.

The Bonanza Con. M. Co. of Park City has been incorporated, capital \$150,000. W. H. Dodge is president; J. R. Valentine, vice-president; J. E. Caine, treasurer, and L. B. Hughes, secretary. The com-

pany owns, near Park City, the Silver Lake, Oliver Twist, Silver Bell, Columbia, Little Chief, Key West, Lucy, Triangle, Fraction, Clark, Dodge, Eclipse, Black Hawk Nos. 1 and 2, Liberty and Center claims, and also a bond and lease on the Ivanova.

## WASHINGTON.

## FERRY COUNTY.

The stockholders of the Republic Con. Co., of Republic, have accepted a proposition to issue \$300,000 in first mortgage bonds to secure funds for carrying forward the work. The bonds are secured by first mortgage on all property to the amount of \$300,000, payable in three years, with interest at 6%, the first year's interest being accumulative; that is, not payable except at the company's option until the end of the second year, with the right of the company to pay the bonds off at any time with interest only up to date of payment. Of the bonds \$170,000 is to take up floating indebtedness and \$75,000 is to be applied exclusively to the development of the mine. The remaining \$55,000 is to be kept in the treasury as a reserve fund.

J. Cody, Supt. Flag Staff mine, near Republic, states that he is not working in the shaft which was sunk last year, as no more can be done without installing machinery. He is sinking a new shaft and has opened a fine body of high-grade ore. In the old workings at a depth of 100 feet there was exposed 15 feet of \$15 ore. The ledge was crossed for a distance of 70 feet and no wall reached. The ore outside of the 15 feet mentioned carried values of from \$5 to \$8 per ton. It is expected that before winter sets in the mine will be equipped with machinery and work resumed on the old shaft. The Gold Ledge lies 1 mile south of the Flag Staff. A contract has just been let and work resumed. The face of the tunnel is in 430 feet. The contract calls for its extension 325 feet, which will cut the ledge at a depth of 350 feet.

## PIERCE COUNTY.

The Pacific Smelter Co. has been organized in the State of Washington, to erect a standard blast smelter of 250 tons daily capacity, for handling the products of Darrington mines, 70 miles from Seattle on the Northern Pacific road. It is a comparatively new mining camp, located at the foot of the Cascade range. One mine, called the Forest, is claimed to have a vein 90 feet wide opened to turn out 200 tons of ore daily. There is a 600-foot tunnel, with crosscuts opening stopes. The ore is considered suited for pyritic smelting. Contracts for ore, smelter site, water power and buildings have been let. F. M. Perkins, of Colorado Springs, Colo., is interested in the proposition. A wire tramway will also be erected to convey the ores from the mines to the smelter.

## YAKIMA COUNTY.

G. Welkel and others have located thirteen coal and iron claims in the Cascades, about 50 miles west of North Yakima. A load of the coal has been brought out and tested. It is said to be anthracitic, burning freely without flame or smoke and leaves no cinders. Five veins of coal have been located. They range from 3 feet to 13 feet in thickness. The coal is said to cover large deposits of iron ore.

## WYOMING.

## CARBON COUNTY.

The State Line C. M. Co. has been incorporated to operate in Carbon county, capital \$75,000. Incorporators, J. F. Sampson, C. Ayers and W. W. Wentworth of Grand Encampment.

The Fairview G. M. & M. Co. has been incorporated to operate in Albany and Carbon counties, with office at Laramie; capital \$25,000. Incorporators are W. McGaslin, C. DeKay and A. C. Stead.

The Newman C. M. Co. has been incorporated to operate in Carbon county, with office at Grand Encampment; capital \$1,250,000. Incorporators are C. Sheney, S. Nadney and J. Newton, all of New York.

The Sunnyside G. & C. M. Co. of Kansas City people has let a contract for 100 feet of tunnel work on its mine near Grand Encampment.

It is reported that sampling works will be established at Laramie to buy all the ore offered by miners and sell to Eastern smelters.

It is reported that a consolidation of copper companies is to be made by a company now organizing with capital \$10,000,000, which, it is understood, will buy the Ferris-Haggarty, Kurtz-Chatterton, Rambler, Osceola and Osceola Jr. and Union mines, the Grand Encampment smelter, the Encampment townsite, the Copper State Bank of Encampment, the Pearl townsite in Colorado and several mining properties in the Pearl district. It is also proposed to construct a tramway from the Ferris-Haggarty to the Encampment smelter.

The Vulcan Co. has called for bids to drive a tunnel on its mine near

the Ferris-Haggarty at Encampment. The deepest shaft is down 50 feet.

The Ferris-Haggarty Co. stockholders have received the dividend of 1 cent a share, a total of \$10,000, declared in August.

A find of 3 feet of high-grade sulphides has been made in the tunnel of the Winona-Rex Copper M. Co., 140 feet in, and drifts have been started both ways on the ore body.

## ALBANY COUNTY.

At a meeting of the business men of Laramie, held on the 21st inst., \$87,000 was pledged for a smelter to be built at that point. One man pledged \$65,000, providing it could be shown the mines in the district can furnish enough ore to keep the smelter in operation. A Denver expert is to make an investigation to determine the producing capacity of the mines and, if the report is favorable, work will be started at once.

## FOREIGN.

## BRITISH COLUMBIA.

O. Wethered, president of the London & British Columbia Goldfields Syn.; A. J. Stoneham of London; J. R. Robertson, general manager, and S. S. Fowler, the company's engineer, are inspecting the Granby plant and the company mines at Phoenix and Greenwood. Wethered & Robertson are also officials of the subsidiary company developing 6000 H. P. from the Kettle river at Cascade, and state that the power plant at Cascade will have 3000 H. P. developed before January 1. The power will be transmitted to the various Boundary camps.

The Spruce Creek Con. Placers, Ltd., has been organized in Seattle, capital \$2,500,000, and W. M. Brook of Atlin, general manager. It has bought Captain Martin's interests on Spruce creek at Atlin, the property consisting of an hydraulic bench lease and creek claims near 140 feet below, together with the first water right—2000 inches—granted on Spruce creek. The price paid is stated to be \$35,000. The ground is well opened up.

The Republic and Phoenix groups on Erin mountain, at Slocan, are to be worked on a large scale and will have machinery installed. At the Republic more men will be employed under the superintendency of R. C. Campbell-Johnston. The Slocan-Republic M. & Dev. Co. has been incorporated to operate the Republic mine; capital \$1,500,000.

The last clean-up of the season at the Con. Cariboo hydraulic mine is stated as being about \$35,000. Piping has ceased, owing to the water supply giving out. Excavating for the bedrock flume is being pushed ahead, and it is expected that the flume will be completed this winter so that piping on the bedrock will be begun next spring. There is a strip of bedrock about 2000 feet long carrying from 70 to 80 or 100 feet in depth of gravel that has not been touched. J. B. Hobson is manager.

The Le Roi mine at Rossland has started up and the company is advertising for 700 men, 400 miners at \$3.50 per day and 300 muckers to push cars and shovel at \$2.50 per day. The five-compartment shaft of the mine is down 1150 feet and is under contract to be sunk to the 1500-foot level. The ore bodies are opened up from the surface to the 900-foot level and the output when working will be 1000 tons daily. The new machinery now ready to run is of the most advanced type and the most powerful in British Columbia.

## KLONDIKE.

The total shipments from Dawson since the first of June have amounted to \$18,643,000. The shipments in May, before the law went into effect requiring the issuance of export certificates, would probably make the total \$19,000,000. The final shipments of the season during September will likely not exceed \$1,000,000, making the total for the season about \$20,000,000. The shipments from Dawson do not represent all going from Yukon Territory. The Forty Mile, Big Salmon and other mining recorders' offices in Yukon are also recording shipments through their hands.

## MEXICO.

Dividend No. 2 of \$120,000, 2% on the capital stock of the Greene Con. C. Co., has been declared, payable Sept. 30, making \$220,000 paid this year. This company's railroad from the present railroad terminus to the company's smelters at La Cananea is reported completed half way. Reports from the mines say improvement in the richness and extent of the ore and the smelters are producing from 160,000 to 165,000 pounds of matte, or about 65,000 pounds of copper per day. Improvements and enlargements are being made to the reduction plant, which, when completed, will have 6,000,000 pounds capacity of blister copper per month.

## Personal.

W. A. HUNNEWELL of Butte, Mont., has returned from Nome, Alaska.

O. A. TURNER, manager Tonopah mines, Tonopah, Nev., is in San Francisco.

H. W. TURNER, of San Francisco, is reconnoitering Texas oil fields and Mexican mines.

R. C. GEMMEL of Salt Lake City, Utah, has accepted the management of a large mine in Mexico.

J. B. TREADWELL of San Francisco, Cal., has been examining the asphaltum deposits near Ashland, Or.

F. KLEPETKO of the Amalgamated Copper Co. staff at Butte, Mont., was in Salt Lake City, Utah, during the week.

G. E. LAKE has been appointed manager of the Ermaine G. M. Co., operating the Smoky Hill mine at Wall Street, Colo.

G. L. MILLER, who has been superintending mines at Hunker Creek, in the Yukon, has returned to Vancouver, B. C.

R. J. DAVISON, general manager of the Chairman M. Co., operating at Ely, Nev., has returned there from a month's trip to New York.

N. E. LINSLEY of Spokane, Wash., is examining the North Fork coal mines in Boundary district, B. C., for the Granby smelter people.

O. STALMAN, manager of the Glasgow & Western Ex. Co. mines, in Utah, has returned to Salt Lake City after a year's absence in Europe.

A. J. McMILLAN, managing director of the Snowshoe G. & C. mine at Phoenix, B. C., has returned there after several months absence in London, Eng.

G. E. BAILEY is on a reconnoitering expedition at Daggett and other Southern California points in the interest of the California State Mining Bureau.

A. H. CEDERBERG, of Catasauqua, Pa., constructing engineer of Portland Cement Works, is in San Francisco, looking over the openings for the industry in California.

## Commercial Paragraphs.

THE Weigels Pipe Works, Denver, Colo., are putting pipe lines for water power on Henson creek, Hinsdale county, Colo.

In addition to the lighting and street railway systems and to the small motor circuits about Seattle and Tacoma, Wash., Snoqualmie power is being delivered and used to operate the Centennial Flour Mill and the Capital Flour Mill, in Seattle, and the Tacoma Smelting Co.'s plant, in Tacoma, where the power equipment is electric throughout, comprising a complete installation of Westinghouse motors. This smelter commenced operating by electricity Sept. 1, 1901, the new service replacing three different steam plants about the premises. In the short time that this smelting plant has been operating electrically, the service has been in every way satisfactory.

## Latest Market Reports.

SAN FRANCISCO, Sept. 26, 1901.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

**COPPER.**—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £63 18s 9d per ton.

It is stated that there is a large accumulation of copper in stock in the United States, practically all in the hands of the companies controlled by the Amalgamated Copper Co., and in storehouses of the United Metals Selling Co., controlled by the same interests. The net exports are at this writing about 50,000 tons less than in 1900 at the same date. There is a decrease in the visible stock in Europe, but London price continues to drop, the past week the difference amounting to over ½ cent a pound. The claim is made that consumption in the United States has increased to such an extent that it has absorbed the difference in the exports of the two years, but it does not seem to be proven by any figures. Amalgamated Copper Co. stock has dropped sharply, but the movements from day to day suggest manipulation. The reduction of the dividend rate to 6% has undoubtedly contributed to this, along with the strong presumption of accumulating stocks. The situation, summed up from a copper consumer's standpoint, would appear to be that there is that probability that there will be a drop in prices that at present prices there is no inducement to carry stock.

**LEAD.**—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 6s 6d per ton—2.66 cents per lb.

**SPELTER.**—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton—3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

**ANTIMONY.**—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

**IRON.**—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

**TIN.**—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$3.50.

**QUICKSILVER.**—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs.; Export, \$45.00.

**MAGNESIUM.**—New York, \$2.90 per lb.; San Francisco, \$3.75.

**ZINC.**—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

**BABBITT METAL.**—San Francisco, No. 1, 10c.

**NICKEL.**—New York, 50@60c per lb.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

**PHOSPHORUS.**—F. o. b. New York 50@60c per lb.

**ASSAY LITHARGE.**—San Francisco, 10c per lb. small lots.

**PLATINUM.**—San Francisco, crude, \$19 per oz.; New York, \$20.50 per Troy oz.

**BISMUTH.**—New York, \$3.25, 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

**FERRO-MANGANESE.**—Pittsburg, 80%, domestic, \$53.50, large lots.

**TUNGSTEN.**—New York, \$95c; San Francisco, \$1.15.

**FERRO-TUNGSTEN.**—New York, 37%, 32c; San Francisco, 65c (60%).

**POWDER.**—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

**CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

**FUSE.**—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 9½c per set; 14 oz., 40s., 8½c.

## SITUATIONS WANTED.

An experienced mill man desires position in mill; understands Amalgamation, Concentration and Assaying. Address G. M., this office.

A first-class machinist, engineer and cyanide man wants situation. Ten years experience in cyanide plants; three years foreman; three years superintendent. At reference Box 52, this office.

**WANTED—POSITION AS MINE SURVEYOR** by young man of five years' experience. Technical graduate. Address M., care of Mining and Scientific Press office.

**YOUNG GRADUATE MINING ENGINEER** desires appointment as surveyor, assayer, or assistant to superintendent. Four years' experience in lead, tin, copper and gold mining. Good references. Apply L. T. this office.

**WANTED—SITUATION BY A GOOD AMALGAMATOR, assayer and cyanide man.** Understands mine accounting. Competent to act as manager. Best of references. Address H. J., Mining and Scientific Press office.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

**MINING ENGINEER, graduate Mass. Inst. Tech.,** with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

There is in Butte, Mont., a young man (32) who has worked in all kinds of metal mines in seven different States for 12 years. He has made a study of mineralogy, geology, surveying and timbering for years, and though he still wears a number 7½ hat, yet thinks he is capable of taking charge of and successfully running a mine. There is no question as to his experience and knowledge, only his executive ability needs demonstration; and he has been "man handled" so long he thinks he is fully capable of doing a little handling on his own account. First-class references. Address "Young Feiler," Box 1182, Butte, Mont.

## PLACER MINERS

having PLATINUM, IRIDIUM and other PLATINUM METALS associated with their gold should save them. They are worth about as much as gold. They cannot be saved by amalgamation. For sale or free analysis, send to the Welsbach Company, Broad and Arch Sts., Philadelphia, Pa. For information as to the method of saving the metals, write to the Waratah Minerals Company, Limited, 140 Ellis St., San Francisco, Cal.

## WANTED.

**WANTED.—A SECOND-HAND 5 OR 10 STAMP** mill, or rolls of same capacity, in good condition. Correspondence solicited. JNO. W. COVER, Hotel Donnelly, Tacoma, Wash.

**WANTED, a graduate of Stanford or Berkeley** (mining and scientific dept.) by a California mine. Must be a good surveyor and assayer, with a thorough technical knowledge of absolute mining. To a good man advances will be rapid, but he must commence at practical work. A man with social standing and refinement preferred. Address "Shasta," care of Mining and Scientific Press.

## WANTED IMMEDIATELY.

## A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop. Excellent chance for the right man to better his position, if satisfactory. Answer by letter to P. C. JURS, 1119 Van Ness Ave., San Francisco.

**EXPERIENCED MINING ENGINEER (43)** will leave for Philippines in November. Will accept commissions, and present himself with credentials to reliable parties wishing his services there, after November 1, 1901. Address Supt. M. & M. C. M. & S. Co., Altyn, Montana.

## TO WELL BORERS.

We have six thousand acres of Coal Land to prospect by boring. Who may be interested, communicate with the KNAPPA COAL CO., Astoria, Or.

## FOR SALE.—FOUR WOODBURY IMPERIAL CONCENTRATORS,

USED ONE MONTH. Address H. WHITNEY, Placerville, California.

## FOR SALE.

One Duplex Rix Air Compressor, 20-in. Cyl. by 30-in. Stroke, Driven by Direct Connected 25-ft. Cobb Wheel, 120 H. P.

Will be sold cheap, with or without water wheel. Condition good. Address L. J. HOHL, Cherokee, Butte Co., Cal.

## Quicksilver

## IN LOTS TO SUIT.

Write for Quotations.

REDINGTON & CO., 23-25-27 Second Street, SAN FRANCISCO, CAL.

OF NEW YORK.

Protects owners of PATENTS, COPYRIGHTS and TRADE-MARKS against loss or damage from INFRINGEMENT. Send for Circulars. Pacific Coast Office, 503 California St., San Francisco, Cal.

# THE RISDON Hammered Shoes and Dies.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

**RISDON IRON WORKS,  
SAN FRANCISCO, - CALIFORNIA.**

## The JOHNSTON CONCENTRATOR.

**DURABILITY, CAPACITY AND SIMPLICITY  
: : ARE ITS ESSENTIAL POINTS. : :**

**SAVES MORE VERY FINE SULPHURETS  
THAN ANY OTHER CONCENTRATOR MADE.**

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Send for  
Catalog No. 14.

**Risdon Iron Works,  
HOWARD AND BEALE STS., SAN FRANCISCO, CAL., U. S. A.**

## "THE DANIEL BEST" 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

**EVERY ONE A SUCCESS AND MONEY MAKERS.**

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

## THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## Strength of P & B Ready Roofing.

P & B Ready Roofing is ten times stronger than any paper, felt or any other ready roofing—you cannot tear it, the sun or rain cannot hurt it—gases, fumes, acids cannot affect it in the least—cold weather won't crack it, nor will it catch on fire easily.

The buildings covered with P & B Ready Roofing are the buildings that never leak or cause roofing annoyances. They are the best buildings, for they are covered with the best roofing.

P & B Ready Roofing is the most convenient roofing you can purchase. It comes in rolls, is easily handled and cheaply transported.

DEWEY, STRONG & CO.

(ESTABLISHED 1860.)

SAN FRANCISCO, CALIFORNIA,  
and WASHINGTON, D. C.

OLDEST AND LARGEST AGENCY ON  
THE PACIFIC COAST.

WHY TO BE PREFERRED?

BECAUSE--

Inventors have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that all the inventor's ideas will be correctly conveyed, avoiding mistakes and vexatious delays.  
Inventors living at a distance from San Francisco may, where they so desire, consult directly with our Washington office.  
Inventors receive the benefit of over thirty years' continuous, successful experience.  
A description of the patented invention will appear in the Mining and Scientific Press.

We have a complete Patent Library, including official records since 1793 and full certified copies of all patents issued since 1872. These are for free examination by any one who desires.  
We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches, and give opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete. Inventors' Guide sent free on application.

## WATER PROBLEM SOLVED

We solve your mine pumping problems. Our engineer makes a personal survey of your property. He listens to all your pumping troubles and takes notes of all the things that the old pump won't do. Then we figure on the conditions. Our long experience enables us to arrive at absolutely correct conclusions. We submit plans and cost. If we get the order we build the pump and install it. If the machine doesn't do the work you don't pay for it, that's all. We guarantee results.

## ASSESSMENT NOTICES.

**THE CALIFORNIA DREDGING COMPANY.**—Principal place of business, 120 Sutter Street, San Francisco, California.  
Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1901, an assessment (No. 2) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 16 120 Sutter Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on MONDAY, the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM W. CHEVNEY, Secretary.  
120 Sutter Street, San Francisco, California.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 2) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
ALEX. GRANGER, Secretary.  
Office—Room 223 Crocker Building, San Francisco, California.

**MARINA MARISCANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of September, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 11 Sacramento Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 4th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOVONE, Secretary.  
Office—217 Sacramento Street, San Francisco, California.

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of August, 1901, an assessment (No. 12) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 7 Montgomery Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
HOLLAND SMITH, Secretary.  
Office—307 Montgomery Street, San Francisco, California.

**WILLETTA MINING & MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of August, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
FRANK E. CORDES, Secretary.  
Office—Room 8, 206 Sansome Street, San Francisco, California.

## DELINQUENT SALE NOTICE.

**ETNA PETROLEUM COMPANY.**—Principal place of business, San Francisco, California.  
Notice.—There is delinquent upon the following described stock, on account of assessment levied on the 23rd day of August, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Name.            | No. Cert. | No. Shares. | Am't.    |
|------------------|-----------|-------------|----------|
| J. A. Chancellor | .....     | 7           | \$250 00 |

And in accordance with law, and an order of the Board of Directors, made on the 22nd day of August, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at the office of the company, No. 316 California Street, San Francisco, California, on the 14th day of October, 1901, at 2 o'clock P. M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

R. F. MACLEOD, Secretary.  
Office—No. 316 California Street, San Francisco, California.

## ONCE IN A LIFE TIME

**ELECTRIC HANDY WAGON**  
Lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 48 in. It lasts because tires can't get loose, no rattling, hubs can't crack or spokes become loose, fellos can't rot, swell or dry out. Angle steel hounds. **THOUSANDS NOW IN DAILY USE.**  
Don't buy a wagon until you get our free book, "Farm Savings." **ELECTRIC WHEEL CO.,** Box 239, Quincy, Ill.

AN enormous volume of WATER containing SAND, GRAVEL or SEWAGE MATTER, is the original Invention and Patent of the EDSON MANUFACTURING COMPANY, and has been adopted by them to accomplish purposes hitherto considered impracticable.

BY HAND POWER.

### EDSON PATENT DIAPHRAGM

TRENCH PUMPS.

(For full information by mail, Cable word "Zabumba.") Capacity from 4,000—one-man power—to 6,000 gallons per hour—two-man power.

PROSPECTING and MINING PUMPS.

(For full information by mail, Cable word "Zabarro.") Capacity from 1,000 gallons per hour to 6,000 gallons per hour—one-man and two-man power.

HYDRAULIC THAWING PUMPS.

(For full information by mail, Cable word "Zagaglia.") Used by prospectors in extreme northern countries. Sinks an 8-inch hole through frozen ground at the rate of 3 feet in 7 minutes.

EDSON MANUFACTURING COMPANY, 132-136 Commercial St., Boston, Mass.

Cable Address: "DIAPHRAGM," BOSTON.

Codes Used: A. B. C., Fourth Edition; Lieber's and Commercial.

## Joshua Hendy Machine Works,

Nos. 38 to 44 Fremont St., San Francisco, Cal.

### THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

### MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil

## MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhes Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

## "Union" Hoist.

The above illustrates the 25 H. P. double cylinder, single drum "Union" hoist, with all the latest improvements.

## THE UNION GAS ENGINE CO.

— BUILD THE —

### "Union" Gas Engines

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work in Sizes from 3 to 300 h. p. in actual use.

"UNION" COMBINED HOISTS in Sizes from 2 to 130 h. p. in actual use.

"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 300 h. p., of Single, Double and Four-Cylinder Types.

FIFTEEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are in Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

Office, 248 First Street. Works, Corner First and Clementina Streets. SAN FRANCISCO, CAL.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light  
EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

DISTRIBUTORS TO THE TRADE:

## Prospecting Machinery.

Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything, brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.

## The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

**LEVIATHAN  
CONVEYOR BELT.**

It is not only adapted to the heaviest service, but will run under any conditions in underground, dripping, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

## Spillway for Earth Dams

The requirements of hydraulic mining, and the climatic conditions in California, have developed details of construction of water storage that have cheapness, combined with efficiency, to commend their novelty. The illustration on this page is of the spillway construction in the earth dam of a mining reservoir at Railroad Flat, Calaveras county, Cal. Reservoir sites of much storage capacity are uncommon in the foothills of the Sierra Nevada mountains, where the mines are situated. The grades of the conveniently located valleys are considerable and the widths rule narrow. Where the width is considerable and the grade moderately flat, the only possible dam construction has a length equal to the greatest width of the possible reservoir. Hydraulic mining is not an industry that justifies large investments in such reservoirs, however essential they may be. The height of dam economically possible rarely runs over 30 feet, and earth and gravel taken from the site are the only possible materials for the dam structure. Clearing of the timber from the site is not done. It becomes water killed, and the reservoir area presents an unsightly appearance, which age does not improve.

The catchment area behind these dams where it provides, as is usual, a water run-off far in excess of the storage capacity of the reservoir made by the dam, necessitates special provision being made to protect the dam from breach. The ordinary construction of waterway or spillway for surplus water is as shown in the illustration. It is built into the dam on one side, as far as practicable from the service outlet, and with its floor either on or in the natural surface. The latter is preferable, so that the approach from the reservoir side is in a cut and the discharge in a cut. The structure is given considerable depth—12 feet in the one illustrated, and sometimes as much as 20 feet, below the top of the dam. The object of this is to keep the water level in

Spillway in Earth Dam, Railroad Flat, Calaveras County, Cal.

the reservoir, during flood or overflow stages of the water supply from the catchment, below any possible danger stage to the dam. The full reservoir level being, say, 3 feet below the top of the dam, the spillway bottom is 9 feet or more lower. When it is desired to have the reservoir full, and there is no surplus to lose, timber gates, for which the large vertical timbers shown in the illustration are the guides, are closed down and the water permitted to fill the reservoir. This form of construction is found

satisfactory as a protection to earth dams having an extreme height of 60 feet. The full depth of the spillway is kept open throughout winter and spring, until the flood season is passed, and then closed down in time to get the full storage before the season run-off ceases to flow.

## The Sheep Ranch Mine, Calaveras Co., Cal.

This mine, an illustration of which appears on this page, is well to the eastward of the Mother Lode system of veins where the latter crosses Calaveras county. The ore vein is a small one, averaging about 2 feet, but remarkable for the great continuous linear extent (1200 feet) of the pay shoot and the uniformity of the yield as the workings extended downward. The mine was opened and operated under the old conditions of California lode mining when cost economies were little known or practiced. The mine yielded in round numbers \$200,000 for every successive 100 feet of depth. This paid dividends to the owners, and costs were not closely held down. The mine in the early workings was opened by inclined shafts and equipped with steam plants sufficient for moderate depths of mining. Ultimately, increasing depth overtaxed the machinery and increased the operating costs, until, at 1200 feet depth, the mine was shut down. As not uncommon under the circumstances, the explanation that received most general acceptance was that the mine was worked out. Really it was the machinery that was worked out.

After several years of idleness it has been reopened. New shafts have been sunk, new machinery installed, and the levels successively below the 1200-foot are found to have the same kind of ore and equal richness of ore with the levels above. Properly equipped and mined, there is found, as with many other old and supposedly worked out mines, more value yet to be mined than already removed.

Mining and Metallurgical Patents; The Sperry Vanning Buddie, 144. Personal; Recently Declared Mining Dividends; Commercial Paragraphs; New Patents; Notices of Recent Patents, 148.

STRATTON'S INDEPENDENCE MINE at Cripple Creek, Colo., claims a net profit of \$190,000 from its production in August. The incident is regarded as exceptional by the owners. It is not the record, however. The Utica of Angels Camp, Cal., has exceeded it with a net of over \$200,000 for one month's run. Possibly other gold mines have exceeded the Utica in a single month's output.

THE fact that the Interstate Commerce Commission report shows that mines furnish practically one-half of the railroad freight of the United States is another strong argument for the establishment of the Department of Mines, with its chief a Secretary. Agriculture, which very properly has a Department and a Secretary, furnishes only a fifth as much traffic to railroads as the mines.

THE strike in San Francisco, Cal., of teamsters and water front labor unions, together with the boycotts, was declared off on the 2nd inst. The terms of settlement publicly declared are substantially what was offered by the employers several weeks since. It is declared by parties interested that there are some private stipulations in addition to the terms made public. The machinists' strike is still on, but early settlement is expected.

It is not many months ago that technical journals contained elaborate mathematical discussions, proving conclusively that the reduction of iron ores, and the production of iron and steel, by electricity was commercially impossible. It could not be made to pay in competition with the blast furnace. It was even denied that an electric furnace had been devised for the process. It is now authoritatively stated that the Stassano process was about to be tested on a considerable scale at Darfo, in northern Italy, using a 1500 H. P. water power and planning to produce 4000 tons of steel yearly. Presuming these figures to be found correct in practice, the commercial impossibility disappears. The cost of the power per ton of steel production, including in the cost current interest on the capital invested in the power plant, would appear to be about \$8. This is more than the cost of the equivalent of coal for plants located at Pittsburg and other great centers of steel manufacture. But transportation of the steel to its market is a cost item the difference in which can easily offset the other difference and bring the two productions into the common market on an equality. While the steel production commercially possible with electricity may be limited, the limitation is likely in the end to be largely due to more profitable commercial uses for electrical energy derived from water power.

## The Mechanical Theory of Placer Gold.

The first stamp mill treating gold quartz in the Klondike was started up last month. The location of the mines is on the Dome, the large mountain on the slopes of which are the headwaters of the several creeks which have been so productive of placer gold. The quartz ledges are said to be carrying much gold visible to the eye, as well as fine gold only disclosed in the milling and high-grade sulphurets, pyrite and galena.

This journal on August 7, 1897, published a paper on the newly discovered Klondike placers, prepared specially for it by one of the leading specialists on placer gold deposits and mining. It refers to it now, as in that paper is written a description of the location and richness of gold-bearing quartz ledges in the Klondike, which were yet to be discovered, that is a true description of their location and richness as they have in fact been discovered.

The discovery and successful exploitation of these Klondike ledges is an unqualified confirmation of what may be termed the "mechanical" origin of placer gold deposits. It will be recalled that about this time (1897), when thousands were planning to exploit the Klondike country, other thrifty hundreds, who sought quicker and easier gained fortunes from exploiting in advance the would-be exploiters, caused the display publication of glacial theories of origin of the placers, of theories of origin by expulsion from volcanoes, of theories of condensation from the atmosphere—in short, of any theory that would not suggest by any possibility the simplicity of the truth, and thus bring within reason the hopes of the fortune seekers.

In the presence of the physical facts to the contrary, belief in these illogical theories must disappear. The logical theory has stood the mathematical test of predicting discoveries with exactness. The specialist who wrote the article for this journal in 1897 had not at that time seen the country or the placer mines. No quartz discoveries had been made. The predictions were made by applying the theory to the few facts then known, which were the meager descriptions of the miners and the gold they brought out with the first authentic news of the discovery.

The mechanical theory of placer gold genesis and distribution received its first full and formal statement and explanation in the MINING AND SCIENTIFIC PRESS in 1894. The relation of some placers to some gold-bearing quartz lodes had long before this time been recognized. There was, however, no general acceptance of the principle of derivation of all placer gold from lode deposits, nor had the simple mechanical principles making its distribution from lode sources been recognized.

Nowadays less is heard than was a few years since in disparagement of the theoretical, to the laudation of the practical miner. Still such a belief exists, and is with every new discovery rampantly assertive, to the deception of many well-meaning people. The story of the gold-bearing quartz ledges of the Klondike does not read that way. The theoretical miner with his pen made the discovery four years ahead of the practical miner with his pick.

As a fact, though, the difference is not as wide as the words preceding would imply. The practical miner and prospector does apply a theory to his work. His theory is the resultant of the facts that he knows, as he resolves them. The so-called theoretical miner is really only a miner who has at his command, and works with, the resultant of more facts. The terms are relative, not absolute. While there is always some difference, it is not the same difference. The practical miner and prospector of to-day would be a theoretical miner from the point of view of his predecessor—the practical miner of thirty years ago.

THE Whitney-Ryan-Guggenheim syndicate are reported to be planning a marketing trust for lead producers. Exactly what is the real intention is not disclosed in the little that has been made public. It is, however, probable that nothing more is intended than a close corporation organization of the insiders who control the American Smelting & Refining Co. These people already control the smelting production and refining of the lead through this last named or-

ganization. They have claimed, doing the principal selling, the control of the selling price. The projected new organization of the same people would make a division in the business activities of the American Smelting & Refining Co., this corporation going out of the selling business in favor of a separate organization of its principals. The smelting corporation must, with the giving up of this branch of its business, give up its profits to the new organization. It will be a sort of family affair resembling closely the old Comstock milling companies organized by the directors of the Comstock mining companies to save the companies the risks and losses incident to operating milling plants.

PROSPECTORS should never permit the opinions of other prospectors or miners to deter them from making a full and complete examination of any mineral that to them looks possible of making an ore body. Such opinions freely given were as freely obtained. Rarely are they conclusions from the facts, or even what appear to be the facts, of a personal investigation or prospecting. Again it is quite possible the other fellows may be mistaken in their opinions. Neither should prospectors be turned away from making a personal investigation by the presence of abandoned works and old dump piles. The more pronounced the evidences of age in these old works the more reason there is for not being influenced by their presence. The original prospector or miner whose abandoned work remains may have been looking for free milling gold ore only and very probably overlooked the presence of pyritic gold ores or the ores of silver or copper. There are many known instances of this. At the present time every metal and many non-metallic minerals have possible values that should not be overlooked. Old dump piles are sometimes pretty good mines, even if they were made and abandoned a quarter of a century since. The prospector should remember he may be looking at the possible mine from a different point than occupied by his long departed predecessor. Another good rule for a prospector is not to locate everything that looks possible that he sees. If having given all the time that is reasonable to the prospect, and it shows nothing of value, better abandon it and look for something else. It is a waste of good money to record locations that do not show good prospects, and location closes the ground against exploration by another prospector without doing the first one a particle of good. Give the other fellow the chance you have discarded as worthless. It is what you would ask for yourself, and he may from a different point of examination find in the prospect the mine you have missed. The mere act of location of possible mineral bearing land is not prospecting. The pick, shovel and pan and not the hatchet and lead pencil are the prospector's tools. When the prospector does find what may be a mine he should develop it instead of waiting for some one else to do it for him, but be sure you have the mine before you decide to stay with it.

SOME of the local capital of Idaho Springs, in Clear Creek county, Colo., is being invested in the interest of the local mine owners, in opposition to the large smelting and milling corporations. A milling plant is being constructed, to be operated in principle, co-operatively, under corporate organization. There is a practical recognition of the milling or beneficiation treatment of ores being a part of the business of mining. Mine owners, presumably those who contribute to the capital, are to get a share in the profits of mill treatment of their own ores and of the profits of mill treatment of ores of mine owners who are not contributors to the capital of the milling corporation. It is readily to be comprehended that these mine owners are independent of outside combinations of capital or treatment plants. The mill they operate may not give the lowest flat cost of reduction for their ores, but the difference is less than the profit the outside capital in treatment plant would add to the lowest flat cost, and these mine owners are at no one's dictation as to the quantity of output their mines shall make. The example of these Idaho Springs mine owners should have the compliment of imitation elsewhere. It is certainly the preferable way to settle differences of opinion as to ore treatment and reduction charges by becoming independent of them.

## Concentrates.

THE cheapest plant for raising 1000 gallons of water per minute 25 feet would be a centrifugal pump with an electric motor or gas engine direct coupled to it.

TO STOP the banking up of the battery sands under the No. 1 or No. 5 stamps make those stamps heavier, preferably by heavier bosses or by keeping full weight heads on them.

"CONCENTRATES" has no record of giant powder exploding in a stamp battery through its being fed in with the ore. Better let some other miner do the experimenting and finding out.

A COLORADO trial court has decided that membership in a stock exchange was a personal privilege and not property, and that it was not subject to attachment and other processes of law.

EVERY person doing business in Alaska is required to pay for a license. In the Juneau district in 1900-1901 this tax aggregated \$100,000, which paid the court expenses and netted \$60,000 to the U. S. Treasury.

THE monthly statement of the Director of the Mint shows that the total coinage executed at the mints of the United States during September, 1901, was \$8,160,401, as follows: Gold, \$4,100,177; silver, \$3,899,524; minor coins, \$160,700.

THE chairman of the executive board of the American Smelting Co. has stated that experiments made by the company show that beyond any question crude petroleum is the preferable fuel for lead smelting and that it has passed the experimental stage of investigation.

IT is said the largest pipe line laid for a Colorado mine has been put in by the Gold Pan M. Co. at Breckenridge. The pipe is of steel, 5 feet in diameter, and the line is 8000 feet long, giving 350 feet of pressure for hydraulicking. The pipe is laid in a trench 7 feet deep.

IN building the concrete floor and walls of the New York subway the construction consists of a thick band of concrete next the earth or rock, then several layers of asphaltum saturated felt, and an inside thick band of concrete. This construction is said to keep the damp outside of the subway.

AN economy of wood fuel is effected by covering and protecting it from rain and snow after it is once dried and seasoned. Records kept at a mine using twelve cords daily indicated that one-fifth more wood was used for fuel where the wood was taken as required from piles exposed to the weather.

THE smallest entry of land as a lode claim made for patent is .004 acre, 175 square feet, the Mineral Rock lode, applied for by the Stratton-Cripple Creek M. & Dev. Co. to protect other and larger holdings. Small as the tract is, it is said the company has expended several thousand dollars in contest over the title to it.

THE cross section of the new Croton dam for the New York City Water Works now under construction has a water face nearly vertical and the down stream face a slope of 50°. The foundation of the dam goes down 131 feet below the natural stream bed and the superstructure rises 160 feet above it, making the total height approximate 300 feet.

CONDENSING STEAM ENGINES require from twenty to thirty times the amount of the boiler feed water to do the condensing with. Approximately, the supply of condensing water should be 1½ gallons per minute for each indicated horse power of the engine. It is usually estimated that the use of a condenser will decrease the fuel consumption from 20% to 25%.

FOR a tunnel or drift grade 5 inches to 100 feet is found to work very satisfactorily. Where cars are moved by hand, the loaded car will run itself down this grade without having to be continually braked, and the unloaded car can be pushed up grade at a rapid walking speed. Where animals are employed and cars are handled in trains, 3 inches to 100 feet, or even as little as 1 inch to 100 feet, can be operated satisfactorily.

THE first thing to do in beginning the proceedings of application for patent to a mining claim is to see that the record of title is clear and complete. Many defects that are found out before applying for the official survey can be straightened out by a relocation. The discovery of them after the application for the survey has been made may necessitate both the relocation and the beginning over again of the application for survey.

WHILE a notice of location does not have to be recorded except in compliance with State statutes or local laws, customs and regulations of miners, the U. S. Land Office, in application for patent, requires a certified copy of the notice of location from the records of the office of the recorder of the county in which the claim is located. Such a record is best made at the time of making the location, though it can be made at any time before application for patent.

THE Supreme Court of California has ruled that the statute as regards the marking of the boundaries of a mining claim was sufficiently complied with by stakes at the corners and a location notice posted on a side line, the ledge being sufficiently developed to show its existence and direction. It appeared that some of the lines in brush were not cleared, but this was held to be immaterial. The decision is opposite to rulings made by some California trial courts in cases where similar questions were raised. It emphasizes the common sense of the

matter by making the ruling in each particular case depend on the facts in that case. If the fact is that the marking is such and the description of them in the notice such that they can be readily traced on the ground the claim is properly marked, independent of literal hair-splitting readings of decisions.

A CORE of puddled clay in an earth dam is preferable to a sheet piling core. The earth and gravel filling of the dam cannot well start the clay core leaking and it can open up the seam of the sheet piling. The latter again may become sprung by the pressure of the saturated filling behind it. A leak once made in it by saturating the outside face of it would lessen its supporting power. Where inside and outside earth masses both contain clay and are both puddled in place in construction the sheet piling answers its purposes very satisfactorily.

IN breaking out a tunnel or drift heading, it is preferable to keep the floor well down, so that there is always a clearance below the bottom of the track ties. After the ties are laid and the rail spiked to them, the track is ballasted with spoil from the heading and brought to true grade by tamping bars. This method of driving and track building lends itself to the easy construction of a water drain on one side of the track way. It is a much more economical and satisfactory way to accomplish the construction of a drain than to blast it out in a separate cut.

THE quotation from the mining report in words, "Providing the ore holds as it is at present, the supply ahead on this one vein is practically inexhaustible, and judging from the samples assayed of an average value \$18 per ton," means just what it says. It says nothing at all. It is intended by stating the promoter's presumption to develop the faith of the prospective investor in stock to the point that he shall give up his money, quickly and cheerfully. The failure of an investment in the ground based on such qualified declarations should not be charged to bad mine management when it is really due to bad judgment in making the investment.

THE copper placers in Alaska are close to the north and south boundary line with the Canadian district of the Yukon. They are in the headwaters of the White river, a branch of the Yukon, or are in the headwaters of Copper river, emptying into the gulf of Alaska. They have been explored from Dalton's Post, on the Alek river, as a base. The country is exceedingly difficult of access and travel. The copper occurs native in moraines. Water is in abundant supply and the wash contains commercial quantities of the metal. The season, however, is short, and, without other natural resources in the country, railroad construction is not justified. The copper in these placers is simply unavailable.

SECTION 5508 of the Revised Statutes of the United States is as follows: If two or more persons conspire to injure, oppress, threaten or intimidate any citizen in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same; or if two or more persons go in disguise on the highway, or on the premises of another, with intent to prevent or hinder his free exercise or enjoyment of any right or privilege so secured, they shall be fined not more than \$5000 and imprisoned not more than ten years; and shall, moreover, be thereafter ineligible to any office, or place or honor, profit or trust created by the Constitution or laws of the United States.

WITH ore and waste broken down together in the mine some sorting should be done at the first handling, when they are being put into the mine cars. Large pieces of waste rock should be taken out at once, and if they can be used for filling they should not go out of the mine at all. Before hand sorting to throw out waste, when the material is on the surface, it should be washed over fine-meshed grizzlies and the settlings from the washing water treated as ore. Waste that is barren rock and waste that contains some ore values that may by a change or improvement in methods or prices become low-grade ore should not be dumped together. The latter should be piled separately and in a position to be easily handled, should it become desirable to make use of it.

IT is always well to remember in prospecting that the surface the prospecting starts from is an accident—if so broad a term can be used—that neither proves nor disproves the possibilities of value with depth. The surface is simply the temporary place that erosion has made on ore-bearing lodes. It may be the erosion has cut down to pay ore and exposes it on the surface. It may be it has cut past the pay ore, distributing it, if gold, in placers, and that the lode is nothing but the channel through which the ore-bearing solutions passed to higher points. It may be that the erosion has cut down nearly to but not into the ore. The condition is one that requires judgment to guess on, whether to follow the indication or to leave it alone. Geology and mechanics help materially to guessing right, and what they indicate should not be neglected.

THE first thing to do in prospecting a lode discovery in Alaska is to scrape the moss off of it. By this is not meant to clean off 2 or 3 square feet and break off a piece or two of the outcrop with a hammer, but a complete stripping for a considerable distance of the apex of the ledge. If very wide, this can be a series of crosscuts. As a rule, there is rarely little soil or broken rock to remove.

The ledges, as a rule, stand out from the wall rocks, covered only by moss and vegetable mold. In addition to the stripping, break into the ledge matter by a number of shallow cuts. They are preferable for the preliminary prospecting to a shaft or tunnel started without a complete surface opening to guide the locations of the more pretentious work. When the surface is opened up and sampling has located its best values, there is something definite to show a possible purchaser or to use as a basis for the further work of prospecting. By all means know the surface of lode discoveries before doing any underground work. Mines have been overlooked and missed by failure to place the tunnels or shafts where the ore values were.

THE Supreme Court has never passed on the question as to whether or not a vein could be followed on its dip under a previously granted agricultural patent. The United States Circuit Court has decided that the vein discovered after patent has issued to the agricultural entry cannot be followed under it, and a few months since a Nevada State trial court decided the other way. This last contest is now in the United States Circuit Court and may reach the United States Supreme Court on appeal. There is a possible phase of the question that may appear as a vital element in determining the ruling of the courts. A vein may be known and may have been claimed and become forfeit prior to the issuance of the agricultural patent. Later a relocation is made. In this case it is possible that the courts would construe the date of discovery of the lode not to be the date of its relocation, but the date of its original location, and would then hold that the right to follow it on the dip under the agricultural patent existed. In other words, the vital facts in such a contention are the existence of value in the lode, and the knowledge that the lode existed before the date of granting the agricultural patent.

WHEN title is obtained to a group of unpatented mining locations by mesne conveyance, and it appears that the boundaries and corners are not properly established, it is usually preferable to make relocations by survey rather than simply re-establish the boundaries of the original locations where the latter were located without survey and without proper establishment of boundaries. The relocation should, however, commence with a survey and platting of the old locations to preserve a record of the physical facts of their monuments, and to have more exact data for laying out the relocations. In this latter as few claims should be made as practicable, and no surface should be left uncovered between locations. Avoid making locations that conflict with each other. Make the lode lines follow the apex lines of the lodes and establish parallel end lines at right angles to the strike of the veins, and not to the apex line, where the latter is not a straight line. In applying for patent, apply on the relocations which have in the U. S. Land Office the effect of new locations. In the event of an attack on the title the old locations can be pleaded to defend it. No rights under the old locations are lost by relocation.

IT has been established that compressed laminated zinc made in the form of thick plates for application as an inside boiler lining, to prevent oxidation and incrustation, is greatly superior to the old method of using raw pig zinc for this purpose. In the use of the pig zinc the galvanic current developed transforms the pig of raw zinc into a more porous substance, in which the metallic molecules are isolated one from the other by the corrosion which is quickly produced, resulting in this, that the intimate metallic contact, which causes the generation of the electric current, is eliminated. Compressed laminated zinc, on the contrary, resists the spongy internal corrosion, as it corrodes only on the surface, thus being very slowly consumed and being capable of conducting the current as long as a metallic nucleus remains. The application of the laminated plates is very simple. They are applied to the walls of the boilers by means of strips and are so distributed that the galvanic action is exercised in an even way, when possible, over the entire surface of the iron. When oxidation is produced in any part of the boiler, it is because the nearest zinc plate is too far away. By this employment of pressed zinc the incrustation of the boilers is avoided, and at small cost.

THE waste heat of steam—that between 140° F. in an 80% vacuum and 60° F., the temperature of condenser water—has been successfully utilized for evaporating sulphur dioxide (SO<sub>2</sub>), which has a much lower boiling point than water. At 140° F., SO<sub>2</sub> vapor has a pressure of 156½ pounds per square inch and at 60° F. a pressure of about 41 pounds per square inch. The SO<sub>2</sub> is vaporized by the heat of the exhaust steam in a special boiler called the "atomizer." The vapor is used in a single cylinder engine either connected with the same driving shaft or put on a separate one. Its work being done, the vapor goes into a SO<sub>2</sub> condenser, becomes liquid, and is pumped to the atomizer again, being used over and over indefinitely. Special construction and packing are required to make the whole apparatus air and water tight. With an apparatus as described attached to a 150 H. P. triple expansion engine of high efficiency an additional energy was obtained from the SO<sub>2</sub> engine equal to 34.2% of the power developed by the triple expansion steam engine. When working it reduced the steam consumption from 11.2 pounds to 8.36 pounds per indicated H. P. hour, which is in effect the saving of 25.3% of the fuel consumption. Another similar engine worked with the waste steam heat of a double expansion engine of 630 H. P. added 41.7% to the total power developed.

## The Purchase of Mining Machinery.

Written for the MINING AND SCIENTIFIC PRESS by FREDERICK T. SNYDER.

There are two aspects to consider in the mining machinery bargain, one, the items to be purchased, the other, the method to be used in making the purchase. In practice this latter is necessarily settled first, and usually resolves itself into a question as to whether the manager or superintendent, who is to operate the plant, will obtain the best results in making the purchase or whether the interests behind the investment will be better served by the employment of one or more specialists. There are two parts of the transaction for which this determination has to be made, either unconsciously or with deliberate forethought; one, a technical part, the determination of what to buy; the other, a commercial part, the ordering of the machinery and the closing of contracts. The skill used in determining what to buy determines a profit or loss of large magnitude. The difference between the possible results of ordering or contracting for the machinery in one way or another is smaller, but may be an amount that would show up well if applied to dividends. If an amalgamating plant is selected where a leaching plant is required, the direct loss and delay may involve the capital of the enterprise. On the other hand, the leaching plant may be secured much cheaper by one management than another, as a result of a wider knowledge of the market or better commercial methods.

The cost of assistance by a specialist in such matters does not increase directly in proportion to the amount involved. It takes little more time to determine and make purchases for construction amounting to \$50,000 than for \$10,000, and in the long run the cost of all kinds of service tends to become proportionate to the time required. The possible saving in the use of such service is directly proportionate to the amount expended. It thus results that assistance to the operating management does not pay in the case of small amounts and does pay in the case of large amounts. This is further modified in the two parts of the matter, as the greater profit or loss possible in the determination of what shall be bought allows a margin for skilled help on smaller amounts, than is warranted by the smaller variation possible in the results of different commercial methods. We find that this corresponds with practice. On small purchases the machinery to be bought is determined and the purchase carried out without assistance by the operating management. On a medium-sized proposition the determination of the machinery to be purchased is put into the hands of special assistance and the ordering alone determined by the operating management. In installations involving the largest investments the plant is frequently designed, purchased and completed before the manager who is to run it becomes connected with the matter. From the standpoint of the investor, the best operating manager is the one who stays steadily in one place, becoming more and more effective in its routine; the best constructing manager is one who moves about from place to place, becoming familiar with the many different ways in which certain results have been obtained among different conditions. As the expenditure under the direction of the construction manager in a given interval of time is much greater than that by the operating manager, he will naturally be a man of greater ability and cost. It neither pays the investor to hire construction ability to do operating work, nor warrants the risk of doing construction work with operating ability.

In this country a strong factor is gradually obliterating the distinction between the technical and commercial parts of the bargain, and the designing and constructing engineer is becoming more and more of a purchasing agent. This factor is the absence of standards in the design and manufacture of mining machinery. Each manufacturer has independently worked out, along different lines, a good solution of any given problem, and specifications broad enough to include desired competition are not detailed enough to protect the non-technical buyer.

The machinery offered may entirely meet the situation it was originally designed for, and yet fail entirely to meet an apparently unimportant condition of the problem in hand. A single machine detail may prevent the operation of an entire plant, and while the manufacturer stands ready to renew (f. o. b. the shop) the part proving defective, this does not recoup the earnings lost during the delay, nor rearrange the company's finances to the date of the deferred start. A consideration of the details by a competent technical specialist, who has studied the conditions under which the apparatus must be used, will alone insure safety. The first part of the purchase becomes combined with the second; what to buy is not determined in detail until the order is practically placed. In this way the constructing engineer, doing frequently what most operating managers do only once or twice or at intervals of several years, acquires a commercial experience along his particular line that is of substantial value to the investor. For the technical part of the work the fee paid the specialist is a sort of insurance premium to guard against mistakes. In the commercial part it

should represent a direct saving, and on the general basis of engineering fees in this country, it is reasonable to expect on investments of \$10,000 and over that the business ability of the specialist will save more than the insurance will cost. To secure disinterestedness and promptness the fee should be a definite sum, agreed upon in advance, and not a percentage of the total investment nor a per diem for the time used. The choice of special assistance in a machinery purchase should be by experience and ability. The determining comparisons of experience and ability are questions of fact. The amount that has been expended under the direction of a man measures his experience, and the profit made for the interests represented in that expenditure measures his ability.

Another factor that has operated to combine the technical and commercial parts has been the willingness of the manufacturer of mining machinery to finance the employment of the specialist. They have paid his salary, and while making no separate charge for such service, have passed it up to the consumer by adding it to the price of the machinery. This has led to waste in the duplication of the engineering of a plant by several competing manufacturers. In the future the growing combination among manufacturers may prevent this waste, but will also remove the competition that originally forced the manufacturer to supply the specialist. At the same time combination among the mines will increase the size of the plants to be built and make the use of a designing engineer more warranted. The outcome of these tendencies will probably be the more frequent direct employment of the construction specialist by the mine owner, with the resulting advantage of technical representation on the investor's side of the machinery purchase. Owing to the economic advantage of standard and duplicate manufacture, the designs of the individual machines will probably remain with the manufacturer, while the arrangement of the machines into a complete plant, owing to the great variety of conditions under which plants are built, makes the use of stock plans a probable loss to some one, and will eventually force the preparation of a special design in each case, closely taking advantage of local conditions—work that is properly not a part of manufacturing.

The exaction of a commission from the manufacturer by a representative of the purchaser, already paid to the amount warranted by ability, will naturally grow more impractical as competition decreases among manufacturers, and is so to a considerable extent to-day, the manufacturer strongly resisting any commissions that have to be paid out of profits below the line of competitive prices. If the representative of the buyer is underpaid and uses this method at the expense of the purchaser to bring remuneration in line with ability, it only illustrates the old difficulty of getting something for nothing. Whether the specialist is to be an employee on a regular salary or an independent engineer with a general practice is entirely a matter of the amount of work to be done for one set of interests. Plant construction and its attendant machinery purchased to the amount of \$100,000 a year warrants a better man than could be profitably employed by the year for work to the amount of \$10,000, and ten companies, each using one-tenth of his time in supervising their work, will be better served than by ten men of the grade warranted by \$10,000 worth of work a year. As these companies combine, in accordance with the economic tendency of the times, this one man ultimately becomes the salaried employee of one consolidation, but his work remains the same.

It not infrequently happens that the non-technical buyer, realizing the limitations of his position, undertakes to secure by financial guarantee the results desired. The alternative is a poor one. The guarantee, assuming that it can be obtained and is backed by sufficient responsibility, does not in any way increase the engineering ability of the undertaker. The plant may fail to do the work in spite of the guarantee, and while part of the amount of its cost may be recovered with the aid of a lawsuit, it does not nearly equal the contingent loss due to the delayed dating on the financial arrangements nor the depreciation in the total value of the property by the record of a failure. The guarantee measures the confidence of the contractor, not the efficiency of the plant or machinery. Commercial responsibility is most desirable, but will not take the place of engineering ability. The desire to secure a combination of the two has led to the development of the contracting engineer. Under this plan the design work—the examination of the conditions and the preparation of plans and specifications—is carried out on the basis of a consulting engineer. When completed, the engineer enters a bid in competition for carrying out the designs and delivering the plant in operation. If the contract is awarded to him, no separate charge is made for engineering. If it goes to a lower bidder, the engineer supervises the construction and both supervision and design are paid for on a consulting engineering basis. Owing to his familiarity with the details, the engineer is usually in a position to underbid any competition. This plan enables the investor to use the best available engineering judgment and insures that the design is thoroughly carried out at the lowest practical cost.

The method of making the purchase settled, there

remains the determination of the items to be bought. In this there is first to be decided the question of the kind of machinery to be bought. The conditions to be met determine this. There should be as much of facts and as little of opinion as possible. What has been successful elsewhere under the same conditions is what is wanted here. Sometimes a new combination of conditions forces a new solution, but such cases are far from common. Mining as a business shuns experimentation.

Next is to be settled the amount of each kind—in other words, the investment. The function of all machinery is to reduce the labor item per unit of production. The size of the investment is controlled by this. Mining machinery proper, as distinguished from handling and reduction machinery, also reduces the cost of capital per unit of production, as it reduces the length of the investment, by increasing the amount of work that can be done in a given time per unit of available working space. With handling machinery, such as hoists, tramways, etc., the cost of operation decreases per unit of production both as the investment increases per unit and as a whole. A compound condensing hoist brings up ore more cheaply per ton than one with simple engines, and the largest hoist takes less men per horse power than the smaller one. With reduction machinery, both the cost of operation and the profitable returns increase with the investment per unit. As the investment per ton operated on is increased, the profitable returns first increase faster than the cost of operation and then more slowly, so that, beyond some point in each case, additional investment means a loss per unit of production. Two vanners in place of one would produce more concentrates and cost more to run, but probably show a net saving. Four in place of one would show a saving but little larger than the two, while the additional cost of operation would probably absorb all the difference. The great saving per ton of a large plant over a small one, which exists to a considerable extent as a belief of the popular mind, is not due to the larger absolute investment in reduction machinery, but to the saving in the labor item in the use of handling machinery, and it should so enter into calculations regarding increased reduction capacity. As all mining operates up against a limit fixed by the boundaries of the ore bodies, any increase in investment represents an increased charge per unit of total production.

Another factor affecting the size of all investments in mining machinery is the compound interest on the net value of the output, which begins as soon as it is marketed. In the special case of a dredger working well prospected placer ground, this is the controlling factor in determining the number of yards to be reserved for a given dredger investment. That is, at the end of an interval of ten years, one dredger with a given amount of ground will show a smaller net return than two dredgers working out the same ground in five years, the interest on the output for the average difference of two and a half years being much larger than the total depreciation on the cost of the second dredger.

Whether any proposed investment in machinery means a real net saving depends on its relation to the point where these different effects balance. Usually sufficient data is available as to ore in sight and operating charges to make it a matter of fairly close calculation. Ore out of sight and hoped for has properly no place in such calculations. It is so common to do things with machinery that it is frequently lost sight of how many things can be done by hand tools, and investments are occasionally entered into where the same amount invested in wages would show a higher net return in the end.

Naturally, the parts of an equipment should be uniform in size. The loss of interest on unnecessary capital put into air-drill capacity that will break more rock than the hoist will handle, or into a hoist that will put more rock on the surface than the mill will reduce, comes out of dividends. It is especially desirable that the total funds available be put up against the total work to be done, and the latter undertaken in such proportion that the funds can be reasonably appropriated to cover the whole. It does not lead to profit to have mill and no mine, nor a mine plant and no method of reducing the ore.

A PARTY of directors from New York made a visit to and examination of the company's placer mine in Nevada. On their return, among other matters, they reported that the placer ground was undoubtedly very rich and exhibited about \$90 in gold dust which they said they had panned out at places of their own selection. It seems they had driven over the ground, a valley several thousand acres in extent, and had their hired driver dig and pan samples of the surface ground at points they selected. Still they were unable to understand why the mine failed to pay.

THE Pacific Coast Oil Co., an ally of the Standard Oil Co., will this month begin laying an oil pipe line 250 miles from Bakersfield, Cal., to Point Richmond, on San Francisco bay. A thousand men will be employed in its construction. The work is estimated to cost \$3,000,000. There will be ten pumping stations along the line.

### Genesis of Ore Deposits.

TO THE EDITOR:—I have read the very interesting article by Matt W. Alderson on the "Genesis of Ore Deposits," and must confess his deductions are rather startling and smash the old idols (theories) at a blow.

The man who wishes to keep abreast with the advance of the world in any line cannot be conservative in these days; but, on the other hand, he must not be too prone to follow blindly every theory advanced. Though laying no particular claim to deep knowledge on the subject, and while acknowledging the ingenuity of Mr. Alderson's theory, still, I can not make this theory of his fit some of the cases that

as shown in Fig. 2. In fact, these two sketches are taken from different parts of the same ledge, on the same level, about 500 feet apart and 700 feet vertical from the surface. That changes do take place in many ledges after formation is, I think, apparent to any mining engineer of five years' practical experience.

I have often seen marked signs of a secondary crushing of ledges, perhaps into minute grains, and a redeposition of its mineral contents encased in a different mineral deposit from the original gouge. These secondary changes are undoubtedly the cause of the so-called oxidation, and are wholly due to the action of the solutions of favorable character on the crushed ledge matter, circulating through the thousands of interstices before recementation takes place.

In fact, water charged with any one of the many sulphides that are known to precipitate the various mineral and metallic salts (sulphates), with the known thermo-electric forces in the earth acting on the crushed and re-ground rock of the encased ledge, could and undoubtedly has altered, in many cases, the original character of the ledge matter.

In regard to the possibility of nature to form such walls as are found on the sides of fissure veins, I should judge that the very fact of their existing was proof that it was possible for nature to form such walls.

In the replacement theory one can see readily how the walls are formed and the banded formation shown in some ledges be accounted for.

Where not powerful enough for this, or where the force was more or less parallel with dip or strike, the line of fracture would naturally be along the line of least resistance, which would be on the general line between the country rock and the ledge. There might be several hundred of these movements, some one way and some the other; but it would take but few to form the ordinary wall, as found in nature.

Where the edge of ledge matter was more or less uneven, the uneven edges of the country rock would be carried away and the abrasion of the quartz against the softer country rock would produce the smooth wall and the clay (ground-up country rock) gouge. In times of quiet this gouge could be acted on by new solutions and converted into a separate seam of ore, and thus various seams could be made in the aons gone by. Where the country rock and ledge matter are somewhat similar in hardness, the tendency would be to polish one or the other, or both, along the line of the wall fracture. I have a piece of quartz in my collection taken from next the hanging wall of a ledge. It is highly polished and lustrous.

There was a thin clay gouge between this and the wall, and the wall itself was slick and smooth.

In the older formations, where the ledges are well defined and have both walls well developed, it might be hard to define the source or mode of formation; but in the Tertiary formations from observation I am led to believe all ledges are formed by the decomposition and replacement of the country rock by solutions moving along well-defined fissures (cracks). I never go into a mine without looking for the indications, and I nearly always find them. Take the case illustrated in Figs. 1 and 2. A, A is the original fissure, and in Fig. 1 is the hanging wall. In the fissure is found a seam of calcium sulphate from  $\frac{1}{2}$  inch to 2 inches thick. The hanging wall in Fig. 1 is smooth and has enough clay on it to show a mark when rubbed with the finger.

The gouge along the fissure is a hard white quartz, showing indications of lime ( $\text{CaSO}_4$ ), and cut at inter-

Vertical Section

have come under my own observation during my practical life, and so am constrained to raise a few questions, with the most courteous of intentions. From observation I am led to believe that most ledges are formed by replacement, by the action of the solutions flowing or seeping along fractures in the earth's surface, which we will call fissures; but these fissures in all cases, I am led to believe, are never of any considerable width, and, as a rule, consist of a crack, slip or fault, whose sides touch.

The solutions causing this replacement, decomposing the constituents of the country rock and replacing its minerals with other minerals and metals held in solution, may be either surface water or subterranean, or a mixture of both.

Sometimes the decomposition and replacement take place on one side only of the fissure, as shown in Fig. 1. At others the action takes place both ways,

One wall may be the original fissure, as shown in Fig. 1—the hanging wall.

Where the decomposition and replacement took place both ways, as was undoubtedly the case in the same character of rock, as a general rule the ledge matter remained as a mass, blending, more or less unevenly, gradually into country rock. When those cosmic movements and alterations mentioned by Mr. Alderson took place, due to the cooling of the earth's crust, lateral pressures, volcanic action, earthquakes, etc., these movements, upon reaching a ledge thus formed, naturally would follow the lines of least resistance, which would naturally be along the edges of the ore body, it being harder than the country rock.

At times, it is true, these movements were of such strength that the ledge itself was rent and faulted both with its dip and strike.

vals by the seams of calcium sulphate that radiate through the country rock, as shown. Receding from the wall, the indications of alterations gradually begin to appear in spots, many crystals of feldspar, replaced by silica, retaining their original form. This continues more markedly from the line B, B, where the country rock retains its characteristics, but is much silicified and carries but little value. At about the line C, C the action of the solutions ceased and the country rock shows no sign of silicification, and is much softer than the part between B, B and C, C.

From the hanging wall side (Fig. 1) no lime seams penetrate the ledge matter, but from the opposite side this happens frequently.

In Fig. 2 it is seen that the lime seams cut into the ledge matter from each way.

This ledge was much faulted and in the upper por-

tion (500-foot level to the surface) both walls were very much in evidence and the country rock, an andesite, very much decomposed and oxidized.

I deem it would be hard to harmonize the case described in Figs. 1 and 2 with the surface-stream deposition theory. In this ledge the upper decomposed section showed undoubted evidence of secondary crushing, redepositions of metals and recementations.

Sometimes the second cementation was effected by silica and at others by calcium sulphate.

In places the country rock was affected, and I have in my collection a piece of decomposed, oxidized country rock, apparently worthless, but parting it one sees a geode of quartz containing copper carbonate, much free gold and some black sulphides. It is a curious and valuable specimen, and a chapter on geology in itself.

If there are no secondary reactions in ledges, how can much of what I have said be accounted for, or how will we account for the local enrichment along the lines of some faults (a, a, b, b, Fig. 3), and none at all along others—C, C?

This drawing illustrates conditions in a ledge I once worked.

The dotted portions next to faults show concentrated gold values. In the same mine, along these faults, rich pockets were found containing free gold in placer shape and brecciated pieces of the original ledge carrying free gold, all cemented together by secondary depositions of calcium sulphate.

Prof. T. A. Rickard also calls attention to the local enrichment of ore bodies at the intersection of seams or faults in his article, "The Formation of Bonanzas in the Upper Portions of Gold Veins," presented at the Richmond meeting of the American Institute of Mining Engineers in February, 1901. If ledges are only formed by flowing streams on the surface of the earth, how will we account for ore seams found along faults—true faults, not supposed ones? I call to mind one, and illustrate it in Fig. 4.

The section R was faulted at C, and an adit run from the surface at that level had followed the fault for over 200 feet. The ore was cut off square at C and no further trace of the ledge could be found. Along the fault was a seam of quartz about 8 inches wide, carrying free gold at times, but its general characteristics were very different from those of the main ledge.

An upraise was started along the fault A, A above C, but no sign of ore was found above the upper edge of the main ledge, although the fault continued in that direction, as shown.

The seam C, E going down at right angles to the ledge was not worth working. A crosscut was run into the foot for over 100 feet, with no results, and that part of the mine was abandoned for about two years. Afterwards the writer, examining the ground, decided the country rock to belong to the hanging wall and continued the crosscut, contrary to every opinion, for over 90 feet farther, cutting the main ledge at D, in good ore. The horizontal distance between the two main fragments was 240 feet, and subsequent work developed the conditions shown in Fig. 4. There was an 8-inch seam of ore, carrying more or less gold, on the fault A, A between C and E, but it did not go above or below either fragment. Where does the river come in here? I call to mind a mine in the State of Chihuahua—a bonanza mine—in which the ore body, about 7 feet wide, lies between two more or less parallel seams—the foot and hanging walls—in an andesite formation. The fissures continue quite a distance each way, but the ore shoot is barely 60 feet long, horizontally. The gangue is a decomposed, altered andesite, highly impregnated with iron oxide, carrying from one and one-half to fifty ounces per ton in gold. The ore, besides, carries quite a quantity of sphalerite, though no gold is contained in the zinc.

Very little gold is seen with the naked eye, even in the richest of the rock. In this ore body there is no sign of replacement or original precipitation. It is simply an altered and decomposed, crushed country rock, saturated with gold-carrying solutions, from which the gold was precipitated by chemical action—which can be reasonably explained—in almost microscopical form in the multiple interstices of the rock.

So markedly is this the source of the gold that on the foot wall side samples taken 10 feet from the wall went \$8 per ton. How will the surface-stream formation theory account for this, or the conditions found in Cripple Creek, Colorado, particularly in the Gold Coin mine at Victor?

If ledges were ever formed in flowing streams on the surface of the earth they should be forming today, and we have no sign of such occurrence that I have heard of. I believe—and I believe that most every student of vein formation believes—that that natural phenomenon is going on as surely to-day as it ever was.

As stated, I am led to believe that ledges are formed by the coursing of solutions along fissures (cracks), mostly closed; and the idea suggests itself to me that that flow was not, and is not, necessarily in a stream, but may be the gradual seepage of the solutions from grain to grain, cell to cell and interstices to interstices.

In fact, this is the most reasonable supposition, and certainly would be the one most conducive to the

replacement and precipitation of minerals and metals. This is a slow process, to be true, but in nature a thousand years are as one day; but the results, nevertheless, are sure.

In regard to following ore shoots: Could there not be sinuosities in subterranean currents or lines of seepage, as suggested, as well as in surface streams? All currents certainly follow the lines of least resistance.

In making these assertions and comparisons I am speaking but for one, and he in nowise a "light" in the world on the subject treated. But the ideas here stated are the expression of my interpretation of the part of one of the leaves of Nature's great book.

What I have written has been actuated more from a desire to learn, by starting a discussion on so interesting a subject, than from any animus to criticize. Mr. Alderson certainly takes a radical stand, and one that many of us must study much before we can adopt it.

E. A. H. TAYS, C. and M. E.  
San Jose de Gracia, Sinaloa, Mexico.

## The Head of the Animas River, San Juan County, Colo.

[STAFF CORRESPONDENCE.]

A trip to Engineer mountain is full of interest. This prominent peak, rising to an altitude of 13,700 feet, forms part of the divide between San Juan and Hinsdale counties. It stands as a watershed to three streams. Its southwestern slope drains into the Uncompahgre that rushes down via Ouray; its southeastern slope faces the head of the Animas, while the basins on its northern side form the headwaters of Henson creek, that empties into Lake fork of the Gunnison at Lake City. Just east of Engineer, separated from it by a pass, are Mounts Seigel and Wood. On the northeast slope of the latter is Burroughs park, whose waters flow toward Lake San Cristoval, whose outlet is Lake fork. The southwestern slopes of Seigel and Wood drain into the Animas.

The watershed between the Animas and Uncompahgre is at the southern base of Engineer mountain, and is characterized by groups of small lakes, pools and springs. Just south of this saddle are Mineral hill and Mineral flats, and farther south is Tuttle peak.

Surface croppings and development clearly show a mineral belt trending through this section in a northeasterly and southwesterly course. It comprises four or five parallel fissures cutting through a porphyry formation. The belt, embracing these ledges is, approximately, 2 miles wide, and passes through Engineer mountain, Lake mountain, Mineral hill and Denver hill. It is claimed to be traceable to Hurricane peak and Bonita mountain on the southwest and to Henson creek on the northeast. Locations on Mineral hill, Mineral flats, Lake mountain and Engineer were made in 1878 to 1890. The Red Cloud, on Mineral hill and flats, comprising twenty-two claims, were doubtless among the earliest locations in San Juan county. In those early days—from 1878 to 1890—the village and postoffice of Mineral Point was a busy place, and 2 miles down the stream, at Animas Fork, were two or three small smelters and a mill. The following properties, all located within a mile of Mineral Point, were partially developed and for a time were shippers prior to 1890: San Juan Chief, Polar Star, Old Lout, Ben Butler, Red Cloud, Bill Young, Vermillion, Cacique, Maud S., Palmyra, Mammoth, British Queen, Engineer and Red Cross. Shipments from all these doubtless aggregated about \$1,000,000. The ore shipped, as a rule, was an iron sulphide, carrying possibly 7% to 10% iron, very siliceous, running high in silver, with some lead and zinc sulphide in places. Throughout nearly all these veins are also found gold values running from \$2 to \$6 to the ton. Much of the ore ran from twenty ounces to forty ounces silver.

Very little has been accomplished in the district within the last eight years. About that long ago T. F. Walsh, now owner of the Camp Bird, produced ore from the Ben Butler of the value of \$25,000, while he had that property leased. His values were silver, lead and gold.

Most of the development on the ledges that pass through this divide, between the Animas and Uncompahgre, was through shafts. As pointed out before, the surface here is covered with lakes and springs, and, as a consequence, it required vigorous and expensive pumping to keep the shafts and levels clear of water. This expense and difficulty was one of the great discouragers. The shafts generally range from 50 to 300 feet deep. The slump in the price of the silver was mainly instrumental in lessening work and stopping development then. The district is now coming into favor again. All holders now look closely after their taxes, titles and corner monuments. Within the last year or two many options have been given by parties desirous of grouping claims together; and the solution, possibly now in sight, is to drive deep crosscut tunnels for drainage and development and provide for concentrating the ore. There are suitable locations for such tunnels on both the Animas and Ouray sides. A little farther down the

stream sufficient water can doubtless be had for power and milling purposes.

L. B. Jackson, engineer and contractor of Chicago, Ill., has secured options and other control of forty-eight claims for parties in that city. The holdings he is endeavoring to group together include the San Juan Chief, Ben Butler, Red Cloud, Bill Young and others, which cover portions of the several parallel fissures and extending over both sides of the watershed. The work being planned is to drive a 2600-foot crosscut tunnel from a point below Denver hill, to take a northwesterly course through the latter hill, on through the Ben Butler to the San Juan Chief, cutting under the Butler at 600 feet depth. This tunnel would cut through Denver and Lake mountain, which really form a part of the watershed.

The Old Lout, located in Poughkeepsie basin, that drains into the Uncompahgre, was one of the biggest producers in earlier years. It is rumored that it and the adjoining Maid of the Mist have been acquired by A. E. Reynolds and others; and it is observed that Mr. Reynolds always gets properties for the purpose of working them.

The Polar Star is on the south side of Engineer mountain and is on the same fissure that passes through the San Juan Chief and others on Mineral flat. It has been well developed and belongs to Mr. Crooke and associates.

Park B. Beatty has charge of the work on the Uncompahgre Chief, which belongs to New York parties. It covers a portion of a vein between the San Juan Chief and that of the Butler. He ships an occasional car of ore and is developing further by a crosscut tunnel.

E. M. Brown, who has been a resident of Mineral Point district for twenty-six years, has had charge of the San Juan Chief for many years and has a number of locations of his own on the belt referred to.

Denver hill has attracted unusual attention because of both vertical and blanket veins it contains in what many consider a phonolite formation.

As illustrative of the character of the ore in this section, two samples from the Ben Butler ran 18% and 21% zinc, 7% and 21% lead, .5% copper, 37 ounces and 59 ounces silver, .2 ounces and .3 ounces gold to the ton. They also showed 63% and 41% silica, 4.5% and 3.6% iron.

WASCOTT.  
Mineral Point, San Juan county, Colo., Sept. 15.

## The Wallace Mill.

The accompanying illustration presents a sectional view of the Wallace stamp and grinding mill, manufactured by the New Era Machinery Co., Denver, Colo. The crushing and grinding is done by three

stamps that operate inside of a mortar 40 inches in diameter. The stamps pass through apertures in the revolving yoke, shown in the center, and are sufficiently loose therein to permit them to slide either way as the yoke revolves. First one end of each stamp and then the other drops 12 to 14 inches on the ore and then grinds about 30 inches up the incline of the mortar before reaching the vertical to drop again. Thus, the three stamps make six drops to each revolution of the center yoke, with the grinding that follows each drop. The speed in operating is from twenty-four to twenty-six revolutions per minute, resulting in about 150 strokes per minute. The crushing capacity claimed for it is six to ten tons of ore every twenty-four hours, being equivalent to the capacity of a 5-stamp battery. It is stated that 4 H. P. will operate the mill.

Several of these mills are being operated in Colorado and are said to be doing satisfactory work. It is asserted that the grinding feature is advantageous in working partially free-milling ore, as the rusty particles of gold are brightened and prepared for amalgamation.

THE Royal Commission report of coal available in the coal fields of New Zealand says: "We feel it our duty to state in the plainest way that there is no unlimited coal supply in New Zealand, but that, so far as is known at present, the supply is comparatively small, and will be all wanted for the colony's requirements. Of course, there is a possibility that further research may find large deposits, but at present those deposits are not known, and should not be depended on."

# Mining and Metallurgical Patents.

Patents Issued September 23, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

IMPACT WATER MOTOR.—No. 682,664; W. Boekel and J. Boekel, Philadelphia, Pa.

A water wheel and its spindle with a casing in three detachable sections, top section being provided with bearings for spindle and wheel which are removable with it, bottom section being provided with an outlet and middle section being provided with water-way which discharges through nozzles against periphery of wheel.

MEANS FOR CONVEYING POWER TO DREDGERS.—No. 683,063; W. O'Brien Jr., Waipori, New Zealand.

Pipe lengths pivoted together to fold in a horizontal plane, floats for sustaining pipes, pipe lengths being in different horizontal planes and having upwardly and downwardly extending ends to form the pivotal connection.

REDUCING OXIDES OR OTHER METALLIC COMPOUNDS.—No. 683,089; K. C. Wideen, Brooklyn, N. Y.

Extracting aluminum from its oxide by putting the oxide into a furnace, forming a vacuum in it, closing the same and submitting the oxides to a temperature greater than that of the oxyhydrogen blowpipe and which alone is sufficient to separate the oxygen.

ROCK DRILL CHUCK.—No. 683,127; F. Long, Footscray, Victoria.

A chuck having a bore for a bit shank, and a keyway through chuck inclined in relation to bore and communicating with chuck bore, a bit shank, and key for inclined keyway having an incision across inner face parallel with bore for bit shank and gradually deepening from inner face of key to a depth such that when deepest part of incision is beside bore

## The Sperry Vanning Buddle.

The Sperry vanning buddle, devised by a Denver man and manufactured by Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., combines the motions of the revolving buddle and the vibrating vanner. The illustration herewith conveys a general idea of the

machine. Numerous tests are said to have shown efficiency in the treatment of the finer slimes. The combination motion, it is considered, gives it greater capacity than that of either the buddle or vanner applied singly; and the manufacturers claim that this increased capacity is no detriment to efficiency. It is claimed that in one test 1800 pounds were run per hour, equivalent to twenty-two tons per twenty-four hours, and it is believed fifteen tons per twenty-

four hours can be run as an average. Slimes worth \$2 per ton from a Black Hawk, Colo., mill were run at the rate of eighteen tons per day, making a 90% saving. Another test of tellurium ore from Boulder county, Colo., resulted in an 80.9% extraction; a test on lead carbonate ore in connection with hard porphyry showed 69.6% saving.

A lot of tailings from an Aspen concentrator

which carried 3% lead and 15% zinc, was tested and resulted in a product containing 46% lead, 10 5% zinc, being an effective separation. A general sample of the concentrate passed through a 200-mesh screen.

The pitch of the table, regulating the speed of flow, and the throw of the vanning motion, which is circular, can be readily changed as the character of the material may require.

key does not project into bore and does not clamp bit shank, key however wedging bit shank when it is driven forward.

COAL OR ROCK DRILL.—No. 683,158; I. Wantling, Peoria, Ill.

A support of two standards connected top and bottom, each with apertures throughout its length, a feed nut of two hinged sections 12 and 20, section 12 provided with extended body 14 and depending body 13 and a yoke-pin for detachably securing feed nut in adjusted positions in frame, dovetailed threaded linings secured in sections and engaged by a thread-bar actuated through mechanism carried in extended body 14, a threaded spindle engaging connecting device at upper end of standards, and adjustable shoe 8 arranged with a series of apertures detachably fixed in lower connecting device of standards by a pin 10 slipped through aperture in support and corresponding aperture in shoe 8.

REDUCING FURNACE.—No. 683,375; C. Bishop, San Francisco, Cal.

Fire boxes at opposite sides, a series of arched plates arranged in furnace and rearward of fire boxes, the plates being perforated, inclined runways below plates, a settling tank for receiving material from runways, and a bullion pot having connection with tank.

EXTRACTION OF PRECIOUS METALS FROM THEIR ORES.—No. 683,325; H. J. Phillips, London, England.

Subjecting the ore without roasting and in form of a powder—under heat and pressure—to action of alkaline polysulphides in solution of such weakness that same will have selective action, namely, will dissolve elements which are combined with gold and for which polysulphides have a greater affinity than for

gold, without dissolving gold itself, which latter is thus dissociated and can then be recovered by any known suitable process for recovering free gold.

REVERBERATORY MELTING FURNACE.—No. 683,378; W. J. Brown, Philadelphia, Pa.

A melting pot built in furnace, a tap hole at bottom of melting pot, a spout communicating with tap hole, a combustion chamber back of melting pot and having an extension directly over melting pot, an inlet opening to combustion chamber, an oil burner directly in front of opening, down flues and return passing around melting pot, an oven with which return flues communicate, oven being situated directly under main portion of combustion chamber, a flue from oven to chimney, a flue from combustion chamber to chimney, a charging opening communicating with combustion chamber directly above fire pot, and a door closing opening.

ROCK DRILLING MACHINE.—No. 683,404; M. C. Jackson, Denver, Colo.

A guide shell and suitable drilling mechanism mounted thereon, a supporting bar, a clamp embracing bar, a plate bolted to clamp and provided with a slot extending parallel with bar, and a groove extending parallel with but larger than slot, a part mounted on guide shell and co-operating with plate, this part having an opening registering with slot of plate, and a bolt passing through slot and opening in co-operating part of guide shell, head of bolt engaging groove in plate, whereby as nut is loosened guide shell may be shifted in a line parallel with supporting bar without loosening clamp on bar or moving latter.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### JUNEAU.

The Rodman Bay M. Co., G. Bent, Supt., is engaged in constructing a narrow gauge railway from the mine to the channel, a distance of 7 miles. The company is building the road for the purpose of being able to ship from and to the mine during the winter when the bay sometimes freezes.

### KETCHIKAN.

Supt. Mellen has shipped 150 tons of copper carbonate ore from Coppermount wharf. The Red Wing mine has also shipped 100 tons of rich copper ore from the same port. A shipment of gold-bearing ore from the Daco properties on Dall island has been made from Howcan.

## ARIZONA.

### COCHISE COUNTY.

B. Frankenberg and N. E. Ferguson, officers of the Pearl G. M. Co. of Bisbee, say of the mine near Bowie station that a tunnel has been driven 135 feet in ore all the way. In this tunnel one high-grade shoot of ore was struck 40 feet long and 20 inches wide, which assays \$80 in gold to the ton. The average of ore taken from one end of the tunnel to the other is from \$12 to \$15. P. Scannon is superintendent. The company will ship the ore to El Paso, Texas.

### GILA COUNTY.

W. H. Mercer and J. A. Valentine, who have bonds on twenty copper claims near Globe, have started a 1000-foot crosscut tunnel. They claim thirty-four leads showing on the surface which the tunnel is expected to cut.

W. H. Mercer, general manager for Crenshaw Bros., of New York and Richmond, Va., who have a bond on the Clipper mine, has let a contract for a 400-foot tunnel. Also, drifting from a winze sunk from the old tunnel, ore has been developed for a distance of 100 feet, which is claimed to average 6% in copper.

### MOHAVE COUNTY.

(Special Correspondence).—The new mill building at the Minnesota mine is up and the new machinery is being put in place with the expectation of beginning operations by November 1st. In the mine a number of men are doing development work and opening stopes. The vein is 2 feet wide, and carries high values in gold, silver and copper, and a considerable per cent of lead. The shaft is down over 300 feet. The owner of the mine, the Philadelphia & Arizona M. Co., propose to sink to 1500 feet. The company has developed a large flow of water in a well sunk to supply the concentrating plant.—J. M. Scratton, manager of the Elkhart mine, is sinking the main shaft toward the 1500-foot level. A short water supply is delaying the starting up of the concentrating plant, and prospecting for water is being done to increase the supply.—The Schuykill Co. are employing forty men. Work is being done on two shafts which it is said will be sunk 1000 feet without let-up. Both shafts are equipped with air compressors and drills, and each heading is advanced about 3 feet daily. Ore is coming out of both shafts.

Chloride, Ariz., Sept. 29.

The Gold Road mines, near Kingman, have been sold to people represented by G. Kislinsky of Los Angeles, Cal. E. Mellarky is foreman at the mine and will start development work at once. A gasoline hoist has been put on the mine.

### FINAL COUNTY.

The Oro-Cobre M. Co. has been incorporated, with office at Tempe, to operate the Goodwin gold claims, at Goldfield, and a copper mine situated near Globe, in Gila county. The latter mine has been bought from Mrs. A. Kinney and J. A. McCarthy and, it is claimed, carries high values in silver and copper. C. Hayden is president and F. M. Schureman secretary of the company.

The Boston-Arizona G. M. Co., located in the Amole district, near Tucson, is doing development work on a series of large veins. A number of surface openings have been made. The grade of ore developed is claimed to be above the average. H. C. Chapin is Supt.

### SANTA CRUZ COUNTY.

Wiley, Gee & Co. are adding new machinery to the reduction plant of the Pride of the West mine at Patagonia to increase the capacity to 100 tons of ore daily. The ore of the Pride of the West is copper, silver and lead.

The Alta mine is being put in repair by an Eastern company. Fifteen men are employed in cleaning out the old workings. The Alta was worked some twenty

years ago by J. K. Luttrell and associates. Supt. Hamill, who has charge, says it is the intention to sink deeper and then stope ore for shipment to the custom smelter at Patagonia.

The Bradford mines, located below Patagonia, which are being opened by Prof. Blake, have developed 10 feet of ore at 150 feet depth which gives an average of 8% to 12% copper ore. The mine is shipping 12% to 14% ore.

### YAVAPAI COUNTY.

The Leviathan G. M. Co. has been incorporated with capital \$3,000,000 by D. M. Purman, W. H. Battin and A. G. Hallett, to develop the Leviathan mine, near Stanton.

The Warrior Copper M. Co.'s double compartment shaft at the mine, near Dewey, is down over 110 feet, passing through small bodies of high-grade ore.

Work is progressing on the Home G. M. & Dev. Co.'s mine, in Weaver district, 6 miles east of Congress. Supt. Hanna says that the incline shaft is now down 60 feet and the ore is improving with depth. A whim has been installed on the shaft.

Luke Bros. have sold the Union mine, in the Pine Grove district, to W. J. Rainy and Detroit capitalists. It is reported, for \$50,000. On the claim a 500-foot shaft has been sunk, besides a large amount of tunneling. The buyers intend to erect a large mill at once.

## CALIFORNIA.

### AMADOR COUNTY.

The Central Eureka mine at Sutter Creek supplies its 20-stamp mill with ore, but Supt. W. R. Thomas is chiefly engaged in opening the mine and developing ore reserves. Next year will undoubtedly see a larger mill. The shaft is now near the 2000-foot level. The 1600-foot level is being pushed to a connection with the South Eureka workings.

At the Baloi, Supt. W. H. Storms is sinking the main shaft to the 1200-foot level. The shaft of a promising east vein is being sunk from 100 feet to 400 feet.

The company reopening the old Bunker Hill, with C. R. Downs as Supt., sinking the old shaft, which was 800 feet deep, to the 2000-foot level, are now down with it to 1250 feet. The old hoist in use is expected to take the shaft down to about 1400 feet. A new hoist will then be installed either this winter or next spring. Prospecting is being done on the 800-foot level, where there is a 100-foot belt of slate, thickly seamed with quartz, believed to indicate a large ore body farther along or deeper. The mine has no mill.

### CALAVERAS COUNTY.

The construction work at Robinson's Ferry of the Melones M. Co. is now in an advanced state toward completion. There are at present 110 men employed. The 60-stamp mill building is closed in and all work on the dam in the Stanislaus river completed. An order has been given for 783,000 feet of lumber to complete the 3.75 miles of flume, which is 8 feet wide by 4 feet deep. This flume, with 700 feet of tunnel and 500 feet of ditch, will convey the water from the dam to the mill. The water is carried across Coyote creek in a 6-foot wooden stave pipe. A small prospect mill and cyanide plant are kept at work testing the ores. In the 60-stamp mill there are two concentrator floors—the first floor with Hallet and Wiley tables, from which the pulp is carried to Frue vanners on the lower floor. In this mill will be used, for the first time in California, belt conveyors to carry ore from the bin to the rock breakers, from the breakers and grizzlies to a small upper bin, and from there through the mill, using a traveling tripper. A silver-plating plant will be installed. The sixty stamps are expected to start work by Jan. 1 next. Then work will be begun installing additional stamps. The mine has been opened up by 11,000 feet of tunnels, crosscuts, drifts, raises, winzes, and shafts, and over \$200,000 has been expended in this development work alone. The main tunnel is 4200 feet long, 8 feet in height by 9 feet in width. Electric locomotives will have 5-ton ore cars. The tunnel is connected by upraises and shafts with the surface on this side of the hill, and opens up on the mine to a depth of 1100 feet from the surface. W. C. Kallston is manager.

Eight men are employed at the Eudora mine, at West Point. In the tunnel a ledge 3 feet wide prospects well. About fifty to sixty tons of ore are being shipped to Selby to be smelted. A stamp mill may be erected after more complete development.

At Fritzell & Evans drift mine on Rancheria creek, near Rancheria, the buildings are completed and the roller mill is nearly finished. The gravel is cemented and has to be crushed. Fifteen men are employed at present in digging ditches and preparing to lay pipe.

At the Kaukaee quartz mine, near Defender, owned by J. B. Dille, a tunnel is in

about 120 feet, but has not reached the ledge yet.

### EL DORADO COUNTY.

The Lagrave mine, near Greenwood, will soon install a new boiler and a larger hoisting engine.

### NEVADA COUNTY.

H. Diener has a bond on the Grey Eagle mine, at Maybert, and expects San Francisco people, who recently examined the mine, to buy it and begin active work soon. It is also planned to erect a 10-stamp mill.

At the Red Cross mine, Omega, two Huntington mills are kept running, and seventy-five tons of ore are crushed daily. At a depth of 150 feet the ledge shows well in free gold. The company is headed by J. A. Brent.

Under the direction of Supt. B. Hoskins work has been commenced on the Eclipse mine at Gold Flat, near Nevada City, and the shaft will be put down to the 600-foot level.

Supt. W. W. Kirkham of the La Suerte mine and Secy. L. A. Rose have bonded the Osceola mine, near Nevada City. There is a tunnel on the property, in which a large ledge is exposed.

H. A. Fairbanks, superintendent of the Keystone mine at Nevada City, reports good ore in the 200-foot level. It is the intention of Mr. Fairbanks to sink another 100 feet before doing stoping.

The Grass Valley Exploration Co. will start up the old Kate Hays quartz mine at Grass Valley. A 30 H. P. steam hoist and the buildings have been constructed and the shaft is to be continued downward. The Crescent mine is to be worked by the company through this shaft.

### PLUMAS COUNTY.

M. Olsen of Nelson Point has discovered a quartz ledge on Dixon creek which is from 7 to 12 feet wide, carrying gold and copper.

### SHASTA COUNTY.

The Archer gold quartz mine, on the South Fork of Clear creek, owned by F. M. Archer of Redding, is reported to have been sold to San Francisco people. Some development work has been done on it.

### SISKIYOU COUNTY.

Several prospects of copper have been found lately in the Joe Creek country, north of Happy Camp.

A Detroit claim has bonded the New Pine claim, at Oak Bar, Klamath river, to which a large ditch 1½ miles long is being built, to operate a hydraulic elevator plant.

A. C. Brokaw, who is operating the Campbell hydraulic mine in Quartz Valley, near Oro Fino, has found a quartz ledge in the same locality. He is putting up a mill.

Prospecting is carried on steadily in the Fool's Paradise district, Yreka P. O., on the lower end of Shasta river, with very good results, rich nuggets being discovered occasionally.

### TRINITY COUNTY.

(Special Correspondence).—The Snow Gulch claims have been bought by C. F. Rose, S. C. Willmott and F. Fletcher. These claims contain rich gravel, but it has been a difficult problem to get water on them. It is now found practicable to get the water, and the buyers will prospect the ground this fall, preparatory to building the ditch and pipe lines next year.—The Northern Headlight M. & M. Co. have completed their new plant and are about ready to resume operations. F. Fletcher is manager.—The Golden Jubilee is making additions to its plant. Carrville, Sept. 9.

### TULUMNE COUNTY.

C. E. Dedrick of Carters has bonded the Black Bart and Dorsey mines, on the main Stanislaus, in the neighborhood of the Star mine.

Supt. J. W. White states that erecting a hoist, putting in a compressor and straightening and retimbering the old shaft at the Porto Fino mine, at Sonora, has been finished and sinking recommenced. It is the intention to sink to a depth of 225 feet, and thence crosscut about 300 feet to tap another vein.

## COLORADO.

For August the net earnings of the United States Red. & Ref. Co. are reported to have amounted to \$65,000, or at the rate of \$780,000 per annum. This is equal to fixed charges of \$180,000, sinking fund requirements of \$50,000, a dividend of 6% on \$4,000,000 preferred stock and a balance of \$310,000, or 5% on the common stock. Only two of the plants of the company have been running—the Colorado Philadelphia and Standard Works at Colorado City. It is expected that the Union, Metallic and National, at Florence, will be all running before Dec. 1.

### BOULDER COUNTY.

An Iowa company is arranging for the immediate development of the Columbia

mine, at Magnolia, which they will operate under a bond. The mill will have a capacity of fifty tons a day. J. H. Kemp is Supt. of the mill, and O. S. Blakeslee, late of Middletown, Conn., is Asst. Supt. and electrician.

T. Williamson of Gold Hill says many old mines at that place are being reopened, unwaters and producing pay ore. The White Cloud mine, which was closed twenty-seven years ago, now reopened, shows 2½ feet of ore at the 80-foot level which runs \$12 to \$15 per ton.

### CHAFFEE COUNTY.

The mining camp of Turret has three shipping mines. The Vivandiere mine is said to be in bonanza. A Cripple Creek company has secured about thirty claims and has begun work.—The Bancroft M. Co. has completed buildings on its Anaconda mine.

### DOLORES COUNTY.

Work on the Pro Patria Co.'s concentrating plant is well advanced. Grading and laying the foundation for the mill and placing of the heavier timbers is completed. W. J. Scoutt is Supt.

### FREMONT COUNTY.

The Smoky City-Colorado M. Co. of Pittsburg, Kas., and Colorado Springs, will sink its double-compartment shaft at Dawson, near Canyon City, to a total depth of 500 feet, the present depth being 50 feet. A body of concentrating ore has been struck and will be opened. The ore will be treated at the Union concentrating plant, recently installed on the Copper King group and used jointly by the several shipping mines of that locality. It has a capacity of 50 tons at present, but will be increased to 200 tons. The ores of Dawson carry gold and copper values. A. K. Lanyon of Pittsburg, Kas., is president of the company and A. C. Paterson general manager.

### GILPIN COUNTY.

The Ingalls G. M. Co. has been incorporated, under the laws of Wyoming, by Cripple Creek and Denver men, to operate in this county, with office in Denver; C. C. Griffin, W. R. Benzie, L. E. Drake, J. M. Shroter and J. E. Hunter are the directors.

### LAKE COUNTY.

The old Printer Boy mine is to be reopened by a new company organized by J. M. Childs of Leadville. P. Ayres is president, J. M. Childs vice-president and general manager and W. W. Detrick secretary and treasurer of the company, with offices in New York City. The shaft and power buildings at the mine are in course of construction and operations will be commenced very soon. It is the intention of the present company to sink to the second contact.

The smelters have reduced the ore output of Leadville over 500 tons a day according to the statement of some of the mine operators. The way they do it is to notify mines that after a certain date only a certain number of tons daily will be accepted. Some mines have been forced to curtail their output over one-half and others over one-third. The small mine suffers more than the large property, and some of these have been forced to shut down entirely. The Smelter Trust claims that it cannot keep up the price of lead unless it can control the output and that right now it is necessary to shut off production to a certain extent.

The shipments of manganese ore from Leadville to the Chicago Steel Works have increased and now amount to over 200 tons daily, of which 125 tons comes from the Caribou mine. The average value of the manganese ore to the miner is \$2.50 to \$3 per ton f. o. b. Leadville. The Phoenix M. Co. is shipping fifty tons to the Colorado Fuel & Iron Co.

C. Stevenson of Pittsburg, Pa., is preparing to start operations on the Rex shaft in Iowa gulch, at Leadville, for the Keystone M. Co. Its property comprises sixty-five acres and ore has been struck by a diamond drill. A large plant of machinery, including a heavy pump, is to be installed.

### OURAY COUNTY.

The Home Pyritic Smelting Co.'s plant blew in Sept. 27 for the winter's run. There are 1200 tons of ore in stock to start on.

The Governor M. Co. has been incorporated, under the laws of Wyoming, by A. Zang of Denver and W. R. Kramer and P. A. Heibler of Ouray, with \$150,000 capital. The principal office is in Cheyenne, with a branch in Denver. The property of the company is the Governor mine, located in the Sneffles district, near Ouray.

### PITKIN COUNTY.

(Special Correspondence).—The Smugler is mining two classes of ore that are milled separately. The first is a heavy lead-silver ore in a spar gangue and the second has about the same percentage of lead and silver, but with zinc added. The two classes come from different stopes from the 900-foot level up. The spar lead

ore is treated at the old mill, where a coarse jig product and a finer table product are made. The lead-zinc ores are handled by the new mill, which makes a lead table product and a zinc middling, though the lead concentrate carries some zinc, but the latter is kept below 10%, and when thus it is not counted a detriment at the smelter. In the new mill are two sets of tables, those on the upper floor, which make a lead concentrate and send zinc middlings to six other tables, which are on the lower floor. The latter make a still closer separation of lead from the zinc. The zinc concentrates, which carry some silver, are being held. The zinc ores here are not a sulphide, but a carbonate, the latter being of greater specific gravity than the former, making separation from lead more difficult. The percentage of iron in them is small, however.

The old mill runs about 160 tons of ore in each day of ten hours and forty minutes, making about forty tons of concentrate that will average about 27% lead and twenty-seven ounces silver. The new mill runs about 110 tons of ore in twenty-four hours, divided into three eight-hour shifts, the product of which is about fourteen tons of lead concentrate that averages about 52% lead, seventy-eight ounces silver and 9% zinc. David Cole has charge of the two mills.

Aspen, Sept. 28.

#### SAN JUAN COUNTY.

(Special Correspondence).—The Natalie M. & M. Co. and Occidental M. Co. own contiguous grounds, extending from the north fork of Cement creek northward, covering portions of Sampson and Los mountains. F. J. Hurley of New York City is president of both companies and the operations on the two properties are unified. A power plant, comprising steam boilers and a Rand 14-drill air compressor, with dynamos for electric light, have been installed in North Fork basin. At this point is the entrance to the Hurley tunnel, now in 830 feet. It takes a north-easterly course and is designed to cut through Sampson and into Los mountain, a distance of about 5000 feet, cutting 2500 feet below the apex of the latter. The old Occidental workings, on Sampson mountain, amount to about 2000 feet, where there is an enormous tonnage of low-grade ore on the dump. The Hurley tunnel will cut 500 feet below these old workings and will crosscut a number of veins in its course that outcrop at the surface. The ores of the group are an iron and copper sulphide, with principal values in gold and silver. It is considered a concentrating proposition. James Lewis is Supt.

WASCOTT.

Gladstone, Sept. 24.

#### SAN MIGUEL COUNTY.

The old Badger mine, on Silver mountain, closed for a number of years, has been bought by A. T. Hathaway, who has let a contract to W. J. Scoutt to drive 1000 feet on the Hathaway tunnel. The tunnel is now in 850 feet.

Ten years ago the Lewis mine, near Telluride, was sold for taxes to N. Mansfield, G. Rohwer and C. F. Painter of Telluride. Recently Mr. Rohwer picked a sample sack of rock from the old dump to make a test. After concentrating it down four into one, the concentrates yielded \$30 a ton. The ore seems a good concentrating proposition, yielding a product carrying nearly 40% lead. There are several thousand tons in the dump, and it is the purpose to treat it next season. It is possible a small plant will be built at or near the dump.

#### TELLER COUNTY.

The Elkton Con. M. & M. Co. has contracted for the installation of another boiler of 250 H. P. capacity. With the three other boilers in use, the addition will bring the total up to 1000 H. P.

The Granite mine, near the top of Battle mountain, Cripple Creek, with its machinery, has been idle for several months. There has recently been a proposition among the owners to start up again. On the 900-foot level a shoot had been opened for 80 or 100 feet that would sort out five ounces in gold to the ton, leaving a large proportion that runs \$40. At the time of the suspension it was declared that a sale was on.

Machine drills have been taken out of the ore shoots on all levels of the Last Dollar, where stoping was in progress, it having been found that the waste with which the ore was necessarily mixed in the use of machines reduced the general value of the rock too materially for sufficient profit. The shoot measures 2 feet in width and the machine broke 4 feet.

Contractors on the Rose Nicol have abandoned work at 450 feet on the crosscut for the second time. Eight dollars a foot did not pay them on striking a hard dyke, and after the rate was raised to \$12 the dyke became harder and still unprofitable.

John Hays Hammond makes the following statement relative to operations on the

Independence, at Victor: "During August there were hoisted from the mine 21,000 tons of rock, and the gross shipments amounted to 8000 tons of ore, with net profit of \$190,000." This was an exceptional month, and the gross tonnage was made with a view of paying the expenses of the new machinery that will shortly be installed and to prepare the property for the output of a larger tonnage of lower grade ore that the increased hoisting capacity will permit.

#### IDAHO.

The table shows the tonnage output of Cœur d'Alene lead-silver mines—first-class ore and concentrates—for the first six months of 1900 and 1901. Valued at \$65 a ton, the total product for the first half of 1901 has a valuation of \$5,436,580. The product of the district's gold mines for the same period is estimated at \$250,000. Tons shipped:

| 1900.               | 1901.               |
|---------------------|---------------------|
| January.....13,526  | January.....16,015  |
| February.....11,052 | February.....13,991 |
| March.....12,994    | March.....17,593    |
| April.....12,695    | April.....13,258    |
| May.....12,421      | May.....12,314      |
| June.....12,374     | June.....10,621     |
| Total.....76,972    | Total.....83,792    |

#### BLAINE COUNTY.

A Mr. Clark has made a strike on Rock creek, west of Hailey, locating a ledge of gold ore from 3 to 5 feet that assays over \$37 per ton.

#### BOISE COUNTY.

At the Washington mine, at Idaho City, sinking to the 600 level has been begun. The mine is equipped with a 5-stamp mill. It is understood that the work to be done during the winter will be running an incline from the bottom of the shaft 300 feet down, following the vein. Later the vertical shaft will be continued on down to the same level and a crosscut run to the ledge. C. Balbach is manager. It is stated that the mill will be started on ore coming from the new development.

The Homestake & Mountaineer M. & M. Co., of Neal, will use the Pneumatic cyanide process in their mill. Chas. Balbach is manager.

#### IDAHO COUNTY.

E. H. Dewey of Nampa, of the Thunder Mountain mine, says that they have drifted 559 feet on the deposit and crosscut it 200 feet without a sign of the limits of the ore body being reached in any direction. The work has attained a depth of 79 feet. The grade of the ore, he says, is improving with depth, and at the last report was running from \$15 to \$20 a ton in every face. The mill, he said, would start on \$15 ore and would treat seventy tons daily.

C. W. Whitcomb of Boston, manager of the Boston & Seven Devils C. Co., states that the company has made shipments this year of ore giving smelter returns averaging 30% copper, \$4 gold and \$2 silver. In extracting this ore something over 10,000 tons of 12% material has been mined and is now on the dump awaiting reduction in the smelter building at Weiser. He says it has been determined to make the plant 180 tons daily capacity, instead of 100 tons as at first planned.

J. N. Stacy, president of the Oro Grande G. Co., operating at Elk City, says that development to date shows 12 to 20-inch vein of free-milling quartz, with average value of over \$100 per ton. A wagon road has been built to the mine and the work will be continued through the winter. A stamp mill will be projected next season.

The Alamance M. Co. of San Francisco has its new 20-ton stamp mill, at Elk City, in operation. Twenty-five men are employed on this property. The ore is free milling.

T. Connolly has located at Newsome Creek a free milling 16-inch ledge which runs up to \$100 a ton in value. An arrastra, capacity two tons daily, is in operation.

The French Creek Co. at Pierce City is running a 5-stamp mill and a sawmill. This company owns thirty-four claims and reports a rich strike on one of them.

#### OWYHEE COUNTY.

Machinery is now being taken from Flint for the construction of a 5-stamp concentrating mill at the White Bros. mines at Silver City.

Leonard & Grete, drifting north from their tunnel on their Banner claim, at Silver City, have cut a shoot of high-grade ore. The vein is 8 feet wide. It is claimed that the ledge samples \$30 a ton.

The tunnel under War Eagle mountain is now in about 5050 feet. It is reported that a 17-foot ledge has been cut, but no prospecting done on it other than cutting through it. The vein is slightly mineralized at the point of crosscut. The tunnel was driven 300 feet in August, and an average of 10 feet per day has been maintained since.

#### MONTANA.

##### HAVERHEAD COUNTY.

Developing the Indian Queen copper claim, near Dillon, is progressing under the supervision of S. J. Dennis, who has a bond on the mine at, it is said, \$50,000, from J. Annear and associates of Walkerville. In addition to copper the ore carries some gold.

G. B. Conway and C. M. Stolle have leased the Iron Mountain mine at Argenta. It has a large quantity of low-grade ore exposed, and it is reported that the smelter will be started up to work these ores.

##### FERGUS COUNTY.

The work of treating the ore of the King-Barnes mine at Kendall has commenced and the cyanide mill has been started up at full capacity. The plant now consists of a No. 5 Gates crusher and two sets of gates rolls, with a 75 H. P. Atlas engine. The daily capacity of the mill is 125 tons, and this can be increased to 200 tons. The tank room is 130x28 feet and contains five tanks, each with a capacity of 125 tons. The main body of ore is directly above the town of Kendall. A working tunnel has been constructed, 300 feet, which runs directly underneath the ore body, and the ore will be stoped into chutes, from which the cars will be loaded, and thence taken to the mill, one-fourth mile distant, by horse power. H. Shaw is superintendent.

##### FLATHEAD COUNTY.

(Special Correspondence).—Cabinet is the name of the new postoffice established in the West Fisher district at what used to be called the Forks of the Road, where a townsite is being cleared and surveyed. The West Fisher district is a lively place, with both stamp and sawmills going. In the A. K. M. & M. Co., better known as the Beager mine, a shoot of ore has been struck which shows coarse gold. This mine will be the first in the camp equipped with an electrical plant for lighting and drilling. The mill is run by water power. W. J. Beager is manager of this property. The new Mother Lode mill, near the Beager mill, is planned to be an exact duplicate of it. The machinery for the Mother Lode will be put in this winter.

J. L. Scarlett, owner of the Cedar group, is doing development work and hopes to get to the producing stage by next spring. Greenwell & Vaughan's big placer mine is understood to be sold for about \$200,000. A large hydraulic plant is to be installed.

F. T. PRESLEY.

Libby, Sept. 21.

##### GRANITE COUNTY.

The Howard Copper Co. has been incorporated to develop some late copper discoveries near Phillipsburg; it is a South Dakota organization, with head office in New York. The company owns the Tiger's Eye and Bush lode mining claims. J. Neu of Phillipsburg is the resident agent, L. U. Loomis president and J. C. Howard secretary.

At the Howard Copper Co.'s mine, near Phillipsburg, the upper workings are reported to show a pay streak with 12% copper in a ledge 10 feet wide.

##### LEWIS AND CLARKE COUNTY.

The Superior & Montana Dev. Co. has begun the development of the mines of the Gold Belt M. Co., at Empire, with S. H. Brady of Houghton, Mich., Supt. Ore has during the old management been extracted from the Empire, Smithville and Bell Boy veins, but the most work has been done on the Empire, on which tunnels have been run to a depth of 460 feet. The Empire mine has a 60-stamp mill, a hoist on the Bell Boy and two air compressors.

A tunnel driven about 700 feet into the Christina mine, owned by R. A. Bell of Helena, has a vein said to be about 48 feet wide of iron and copper ore. Mr. Bell says the ore in the tunnel carries twelve to fourteen ounces of silver, a little gold, 1% to 2% copper and 30% iron, while there are pockets which carry higher values in both gold and silver. This ore he believes to be only the iron cap to a copper vein, which he expects to strike by going down on it until below the water level.

##### JEFFERSON COUNTY.

The Colorado M. & Dev. Co., operating the Hidden Treasure mine near Corbin, is installing machinery.

##### MADISON COUNTY.

F. Johnson has bought a half interest in the Occidental, Tamarack and Uncle Sam mines from T. Stewart of Brandon. The owners propose to commence work on the claims at once.

##### MISSOULA COUNTY.

W. P. Ketcham, Supt. of the Copper Bell M. Co. mine, near Clinton, states that Manager Scheffer of Milwaukee was expected at Clinton, at which time arrangements would be perfected for the commencement of extensive development work on the company's prospects.

The Vermilion placer mine, on Ver-

million creek, has been sold by T. Rodda, A. D. Dorn and J. P. Anderson of Butte, for, it is said, \$50,000. It is a hydraulic proposition and will be worked next year.

C. Dodge of DeBorgia says the most extensive work now being done at that place is by the Deer Creek M. Co., of which D. Cromie is Supt. It has installed a steam 10-stamp mill at its mine, 7 miles from DeBorgia station. Tests of the ore that have been made are said to show up favorably. Ore is now being taken from the mine through a 500-foot tunnel.

##### ONTONAGON COUNTY.

G. E. Perkins has shipped several hundred pounds of rock from the Carp Lake property to Providence, R. I., for treatment. The shipment, it is said, will run one-quarter ingot copper. The shipment is made for testing methods of separating the copper from the rock, which is a sandstone.

##### SWEET GRASS COUNTY.

The Deer Creek M. & D. Co. claim to have made a new strike on the Weaver-Dickson claim, at Big Timber. The ore is a steel galena and the assays show \$70 to the ton.

##### NEVADA.

##### ELKO COUNTY.

The Grand Prize mine, at Tuscarora, is to be reopened and worked again, a company having been organized for that purpose. Work was suspended on account of inflow of water. With improved pumping machinery, it is expected to keep the mine clear.

##### NYE COUNTY.

J. F. Anderson, president of the Tonopah M. Co., states that Manager J. H. Jenkins has made arrangements for machinery and supplies to open the mines as soon as the leases fall in. A 12-mile pipe line will be laid from a point in Ralston valley, near Rye Patch, to Tonopah to provide a water supply for the camp. The water will be pumped up 700 feet to a reservoir, from which the water will have a pressure head in case of fire.

##### WASHOE COUNTY.

The Trimetallic and W. M. Teller mines, owned by A. D. Griffin and situated in the Antelope range, 20 miles north of Reno, have been bonded to a Philadelphia company.

The shaft at the Forlorn Hope mine, in Olinghouse, is down 214 feet. The ledge is over 5 feet wide and the pay streak, it is said, 2 feet wide. The pay ore goes from \$225 to \$250 per ton in gold. The Forlorn Hope has the deepest shaft at Olinghouse and the ledge continues below the water level, found at a depth of about 197 feet.

R. B. Hawcroft, A. J. Taylor, D. Finlayson and E. J. Eddards have bonded to an Eastern company three claims near Reno at \$15,000. The claims are the Buster, Blue Star and Gulch. It is expected that work will begin immediately.

##### WHITE PINE COUNTY.

The Butterfield G. M. & M. Co., a Maine corporation, with office in Boston, is installing a stamp mill at Osceola, having recently bought mines of the Nevada G. D. Co.

##### NEW MEXICO.

##### BERNALILLO COUNTY.

The Jura-Trias Co. has completed its copper smelter at Senorita. The company has also been operating its own sawmill close to the smelter. The company is mining its own coal from a 14-foot vein. Limestone and iron for flux are near at hand. The ore, it is claimed, ranges from 10% upward in copper.

##### COLFAX COUNTY.

A number of mines at Elizabethtown are making preparations to work their ores at the mines. The big dredger is working successfully on the auriferous gravel of Moreno valley.—The Smithfield Co. of Pittsburg, Pa., of which F. Spurr is the manager, has put in an 80 H. P. boiler for the hoisting works on the Bobtail mine, situated at the head of Grouse gulch.—O. F. Matkin, Supt. of the Legal Tender mine, is working on a tunnel driven to tap the shaft. When this is done the company expects to put in heavy hoisting works.

The tunnel of the Legal Tender mine at Elizabethtown is being driven to intercept the shaft. After the connection is made heavy hoisting machinery will be put in.

The Smithfield Co., of Pittsburg, Pa., for whom Frank Spurr is manager, has put in an 80 H. P. boiler for the hoisting works at the Bobtail mine, near Elizabethtown.

##### GRANT COUNTY.

The Modoc M. Co., operating the Modoc mine, at Organ, is constructing a boarding house and other mine buildings. Work is also to be commenced on a large mill.

The Pacific Union Smelting Co. of San Francisco are putting in a 50-ton furnace at Lordsburg and propose to be ready to

receive ores by Nov. 1, and the Lena M. & M. Co. are putting in a 25-ton furnace and a 150-ton concentrator and propose to be ready to start up about the same time.

The vein struck in the level being run from the bottom of the Manila shaft at Aberdeen assays 11% copper, 3 1/2 ounces silver and \$1 gold.

The buildings under construction by the Cochiti G. M. Co. at Albemarle for the compressor plant are almost completed and the machinery placed in position.

#### SANTA FE COUNTY.

The smelter of the Santa Fe G. & C. Co. of San Pedro has closed down for repairs. It is stated by the manager that it will resume after a general clean-up.

A core drill with 2000 feet of piping has been placed on the Copper King at Red River. The company sunk a shaft which filled with water, and this drill will be used to locate the ore vein.

#### OREGON.

##### BAKER COUNTY.

A strike of copper ore is reported from the Baisley-Elkhorn mountains, near Baker City, made by T. Hunsaker. The ledge on the surface was about 100 feet wide. On sinking a shaft it passed through soft, decomposed vein stuff, which gave some values in gold, silver and copper. At a depth of 60 feet it struck a large body of copper ore which carries high copper values. A crosscut for 12 feet on both sides of the bottom of the shaft is in ore.

The four claims owned by Burns, Monades & Parker in the Buckeye district, near Baker City, have been bonded to Eastern men at \$60,000. The ledge is about 150 feet wide on the surface and the ore values are said to average \$8 to the ton in copper and gold. It is a sinking proposition and machinery will be installed.

The Gem G. M. Co., in which W. L. Vinson and Geiser Bros. are the principal shareholders, is doing extensive development work on the Gem mine, near Sparta. The machinery for a 10-stamp mill is on the ground, and construction is going on under the direction of B. L. McLain. A large hoist for deep sinking is in place, and started up. Thirty men are employed.

The Brazos mine, consisting of several claims in the Virtue district, formerly owned by the Blewetts of Nebraska, and afterwards bought into by A. Geiser of Baker City, has been sold by the latter to W. E. Miller and W. P. Young of The Dalles for \$40,000.

##### GRANT COUNTY.

W. A. Gilliam and I. E. Rose of Granite have discovered and located what they believe to be an extension of the Morris mine in the Greenhorn mountains. The ledge is 13 feet wide and assays \$7.50 per ton on the surface, some of the ore going as high as \$9 to the ton.

##### JACKSON COUNTY.

The Rogue River Q. M. Co. of Medford have five cinnabar claims in Meadows district. A shaft sunk about 10 feet on what was supposed to be a "crossing" on the Mayfield claim has developed a very rich "chimney" of ore, the rock being quite a pure cinnabar. The company claims to have taken \$4000 worth of ore from this 10-foot hole, and has about 2 feet of ore of remarkably high grade to sink on.

The Shorty Hope M. & M. Co. of Jacksonville has been incorporated with capital stock \$1,000,000, to engage in a general mining and milling business, by H. S. Sanford, D. F. Fox and E. A. Sherwin, all of Ashland.

##### JOSEPHINE COUNTY.

The sale of the Golden Standard mine, on Galls creek, by K. K. Kubli, H. D. Kubli, Mrs. E. J. Kubli of Jacksonville and E. B. Watson of Portland to E. W. Forbes & Co. of Seattle, Wash., has been made for \$37,500. The new owners propose to erect a new stamp mill on the property at once.

The Hull & Beck placer mines and a quartz claim on Louse creek have been sold to J. O. Booth of Grants Pass for \$9000. The mine is said to have a well-equipped plant with water for an eight months' run and has been operated since 1888.

##### MALHEUR COUNTY.

Petroleum has been discovered near Vale. Three sections of land have been located by Albrecht & Cowgill for Spokane and Portland parties. It is the plan of the new Baker City syndicate to move a boring apparatus from southern California to the new field in the near future and sink wells in a number of places. An expert has declared that the fossiliferous rock in this oil basin is a natural cement of high grade and that the land is valuable for the cement alone.

T. D. Wilson of Denver, Colo., is re-

ported to have made a test of the surface ground in Big Bend district, near Ontario, putting down a number of test pits about 12 feet deep, to water level. The tests indicated values of about \$1.70 per ton. A plant to work twenty-five tons of the surface gravel daily is projected.

#### SOUTH DAKOTA.

##### LAWRENCE COUNTY.

The Wasp No. 2 Co. claims that it is making money on ore that runs as low as \$4.50 per ton, the cyanide process being used exclusively in the treatment. The 50-ton plant is at Lead, and the ore treated is a quartzite, which rests upon the slates.

The Two Johns M. Co. will install a diamond drill at their mine in Crown Hill district, near Lead, to explore for ore in the quartzite. The mine is owned by C. A. Hallan and associates of Chicago.

The main ledge of ore in the Grizzly Bear mine, near Hill City, has been found. This mine is owned by the Lakota M. Co., L. G. Linn of Denver, Colo., president. The 20-stamp mill will soon be started up.

The ore from the lower workings of the Black Hills Copper Co., Rochford, has improved in value. The incline shaft at the 600-foot level has entered ore that carries about 2% copper and \$4 gold. The company is figuring on the erection of a smelter.

Lead people have organized the Potsdam M. Co., intending to work over old dumps in the Ragged Top district with cyanide process. Tanks have been installed and the plant is ready for work.

The new Homestake cyanide mill, work on which has been commenced at Gayville, will not be quite as large a plant as the one at Lead, but will be built for the treatment of tailings from the 420 stamps of the DeSmet, Deadwood-Terra and Caledonia mills.

#### UTAH.

##### BOX ELDER COUNTY.

The Gold Standard M. Co. has been incorporated at Salt Lake City; capital \$25,000; W. H. Weyher is president of the company and E. H. Jones secretary. The company owns the Tiger-Poorman and nine other mining claims in Park valley.

The Brooklyn M. & M. Co. has been incorporated at Salt Lake City; capital \$400,000; J. A. Graham is president of the company and R. S. Connor secretary and treasurer. The company owns the Brooklyn group of nine mining claims in Park valley.

The Copper King M. Co. has been incorporated at Salt Lake City; capital \$30,000; H. T. P. Grey is president of the company and G. J. Badertacher secretary and treasurer. The company owns the Roosevelt and nineteen other mining claims in Blue Creek district.

##### JUAB COUNTY.

The Bonanza M. & M. Co. has been organized at Robinson, capital \$300,000, to develop the Copper Queen & Bonanza group of seven mining claims, West Tintic. D. A. Dupue is president, A. J. Underwood vice-president, G. Jones secretary and treasurer.

##### PIUTE COUNTY.

The announcement has been made that the present capacity of the Annie Laurie on Gold mountain will be doubled during the winter. It is also said that work on the lower tunnel, at the mouth of which stands the mill, is to be started up and continued to a connection with the main ore bodies.

##### SALT LAKE COUNTY.

For \$4500 J. J. Burnswood has sold to the Alta Con. M. Co. four locations in Little Cottonwood canyon, near Alta, the company having already begun active development.

A. Murphy has bought the Good Luck No. 2 claim, at Alta, for \$2500, from C. B. Durst and associates. Mr. Murphy, it is reported, will begin active work on the property at once.

The Highland Boy smelter during September produced over 900,000 pounds of copper, gold and silver-bearing bullion of the value of over \$200,000, a new record for the company. This was derived from over 15,000 tons of ore smelted during the month.

The Pioneer Con. M. Co. has been incorporated, capital \$300,000, by A. Murphy president and F. A. Earls secretary, with office at Salt Lake City. The company owns the Good Luck, Good Luck No. 2, Eldorado, Lookout, Pioneer Nos. 2 and 3 and a bond on the Pioneer, in American Fork and Little Cottonwood districts.

##### UTAH COUNTY.

In the Lake Superior country W. Loose of the Big Indian M. Co. has discovered that in his process gas can be used instead of charcoal. He says he is now prepared to proceed with the erection of the Big Indian plant at Provo. A converter will be put in, as at the valley smelters.

#### WASHINGTON.

##### FERRY COUNTY.

Meteor Camp is on the south half of the Colville Indian reservation, which was opened for mineral location in July, 1898. It is reached from Spokane by train to Meyers Falls, thence by stage to Daisy, 20 miles. From Daisy the distance by a good wagon road is 10 miles to the principal properties of the camp.

The management of the Princess Maud Co. has decided to close down the mine at Republic until the new railroad comes into Republic, when it is hoped that by shipments to Grand Forks the property can be put upon a self-sustaining basis.

##### LINCOLN COUNTY.

What is believed to be the first car of Washington lead ore treated by a British Columbia smelter has lately been shipped to the new smelter at Nelson by the Silver Basin M. Co. of Davenport. The ore is silver-lead and the owners make a gain over smelter charges of \$10 per ton on ores.

##### STEVENS COUNTY.

Keswick, Cal., has been one of the sources from which the Northport smelter has drawn men to take the places of strikers. Joplin, Mo., and Leadville, Colo., have also contributed. A trainload of men arrived at Northport on the 1st inst. and went to the smelter without trouble. Six hundred and fifty men are reported hired by the smelter people during the past sixty days. Not all of these men have remained at Northport, as some have gone to the Rossland mines, where they have found work at higher wages.

President J. Brown of the Orient M. Co. says: "Our working tunnel is now in 600 feet. We have not yet struck the main ledge, but have crosscut three others, one of which carries 3 feet of ore assaying on an average of \$100 per ton. The values are principally nickel and cobalt. Several other properties near the Orient also have good assays in nickel." The Orient property is located near Bossburg, a few hundred feet distant from the line of the new railway to Republic, and about 15 miles out of Marcus by way of that line. The distance to Bossburg from Northport by wagon road is 10 miles.

#### FOREIGN.

##### BRITISH COLUMBIA.

Head & Butts Bros., who have been working the Butts hydraulic claim near Barkerville, report a clean-up for the season of 300 ounces, yielding \$5595.

J. J. Palmer, owner of Marble Bay mines, Texada Island, states that he is now shipping 1000 tons per month to the smelter. The shaft is 250 feet deep and there are more than 3000 feet of underground workings.

It is stated that seventy-five tons of ore are on the dump ready for shipment from the sulphur mines on the Oxtal river, a tributary of the Skeena.

Marysville, it is said, has been selected as the site for the smelter of the Sullivan M. Co.

It is reported that the vein in a shaft on the Railway ledge of the Winnipeg mine, in Wellington camp, is widening and improving in value. It is stated that one car from the vein averaged \$34.09 in all values, principally gold. A small hoist plant has been installed.

A. McMillan, managing director of the Snow Shoe G. C. mines, and J. A. Astley, chief engineer, have been examining the mines and say the company is considering the erection of its own smelter as against the alternative of sending the ores to a custom smelter. Data is being gathered. The mines are located in Phoenix Camp, near Phoenix.

A find of gold-bearing black sand on the northwest coast of Vancouver island is reported. Seventy ounces of gold have been taken out.

##### MEXICO.

F. A. Vickery, of Ocatlan, State of Oaxaca, Mexico, says that the Rothschilds have just bought the La Esquadra copper mines at Ocatlan for \$2,000,000 in gold. The La Esquadra mine, it is said, produced \$508,000 worth of ore during 1900, and the output for the present year will greatly exceed that amount.

##### KLONDIKE.

The first stamp mill in the Klondike district has been started up by Spencer & Munger on the Klondike river. The mill is steam power and is working on ore brought from quartz mines now being opened on the Dome mountain, at the base of which head some of the richest Klondike creeks. Quartz claims on Dome were staked out two years ago, but it was not until C. Berry of Fresno, Cal., and his partners began opening some of them this summer that their value was positively known. Berry has sunk shafts on veins carrying rich free-milling ore.

#### Personal.

JOHN HAYS HAMMOND was in Park City, Utah, early in the week.

M. L. EFFINGER, of the Ophir mine, of Stateline, Utah, is in New York.

T. F. LAIRD has resigned as Supt. of the Duchess mine at Vallecito, Cal.

G. B. EARNSHAW, of Bingham, Utah, is in northern Idaho examining mines.

J. F. HOHEISEL assumes the management of the Avino mills, Avino, Durango, Mexico.

F. C. COOLEY, representing the Denver Fire Clay Co., Denver, Colo., is in San Francisco.

J. A. MORTON, of Ontario, Oregon, has returned to that place from a sojourn in Nome, Alaska.

G. PETERSON, of Boise, Idaho, has returned from a several months' visit to Nome, Alaska.

M. ROURKE, late Supt. of the Camp Bird mine at Ouray, Colo., is in Montana examining mines.

A. F. HOLDEN of Bingham, Utah, has returned to that place after a lengthy sojourn in New York.

C. C. KNUTSON, manager of the Great Republic mine, near Northport, Wash., has returned from Chicago, Ill.

C. STEVENSON, of Pittsburg, Pa., has been appointed superintendent of the Keystone M. Co., at Leadville, Colo.

J. E. LYONS, of Lewiston, Montana, has returned to that place after four years of residence in Dawson, Yukon Ter.

W. LOOSE, who has been studying methods in the Lake Superior copper country, has returned to Provo, Utah.

GEO. T. RIVES, late of Lillooet, B. C., is in San Francisco, negotiating sale of some northern California mining properties.

CHAS. BUTTERS is in Salt Lake City, Utah, after six months' absence in London. He will leave for Central America shortly.

J. M. HEUTON, of Deadwood, S. D., has returned there after several weeks absence engaged in examining the gold ore deposits in Fergus county, Montana.

P. H. BUTLER, the discoverer of the Tonopah mines in Nye county, Nevada, and J. H. Jenkins, general manager of the Tonopah M. Co., are in San Francisco.

#### Commercial Paragraphs.

L. W. TATUM, manager of the Oro M. Co., has contracted to use the pneumatic cyanide process in Arizona on a royalty.

PERCY R. STUART, Pacific coast agent A. Leschen & Sons Rope Co. of St. Louis, Mo., reports signing a contract with the Pacific Portland Cement Co. of Suisun, Cal., for a 2750-foot Leschen automatic tramway, stated capacity thirty tons per hour, to carry rock from quarry to mill. The cement company's plant will have a capacity of 1000 barrels per day. Mr. Stuart has a similar contract with the San Luis M. Co., San Dimas, Durango, Mexico, for two 1300-foot spans, capacity five tons per hour. His San Francisco office is 85 Fremont street.

The Bradley Pulverizer Co. of Boston, Mass., report great successes with their Griffin mills, especially among Portland cement makers, whom they report as saying that they are the most economical mills in the market. Among the many recent sales have been twenty-four Griffin mills to the Great Northern Portland Cement Co.; twenty-two Griffin mills to the Lehigh Portland Cement Co., for their new works in Indiana; and thirty-two mills to the Indiana Portland Cement Co., with other sales about consummated. Such large offers from such large concerns certainly argue that the Griffin mills are well worthy of their leading position in the trade.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BED BOTTOM AND UPHOLSTERY SUPPORT.—No. 683,175. Sept. 24, 1901. John Hoey, San Francisco, Cal. The object of this invention is to support elastic bed bottoms and upholstery in such a manner as to prevent breakage and to render the parts more enduring. It consists in the combination with a bed bottom with side and end rails, a woven wire fabric stretched between and conical spiral springs, the bases of which form a support for the woven wire fabric, and transverse tubular rods extending between the sides of the bed bottom, these rods underlying and forming a rigid support for the springs and having their ends fitted to the inner sides of the side rails. Holes are bored through these rods, and the straight extensions at the lower ends of the springs fit into

[illegible]

## SITUATIONS WANTED.

**WANTED—POSITION AS CYANIDE MAN** or Assayer. Understands chemical analysis. Address M. S., care Mining and Scientific Press.

An experienced mill man desires position in mill; understands Amalgamation, Concentration and Assaying. Address G. M., this office.

A first-class machinist, engineer and cyanide man wants situation. Ten years experience in cyanide plants; three years foreman; three years superintendent. All reference. Box 99, this office.

**YOUNG GRADUATE MINING ENGINEER** desires appointment as surveyor, assayer, or assistant to superintendent. Four years' experience in lead, tin, copper and gold mining. Good references. Apply L. T., this office.

**WANTED—Position** by a young man of 28, as private secretary to mining operator or with mining company; is a stenographer and a surveyor; has had practical experience in mining operations, prospecting, and in hydraulic engineering. Address J. A. T., care Mining and Scientific Press.

**WANTED.**—Position as superintendent or general manager of a copper smelter or Bessemer plant. Eighteen years' experience. Speak Spanish. Thorough knowledge of carbonate or sulphide ores. References exchanged. Address Box 601, care Mining and Scientific Press.

**WANTED.**—Position by a practical mine foreman in America or Mexico. Have twenty-one years' experience in gold, silver, copper, lead and tin mines. Speak Spanish. Have best of recommendations. Modest salary required. Address J. R. H., care Mining and Scientific Press.

**WANTED.—SITUATION BY A PRACTICAL** mill man, assayer and cyanide man; is also a practical miner. Understands mine bookkeeping. No objection to Mexico. Best of references. Address W., care Mining and Scientific Press office.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

**MINING ENGINEER**, graduate Mass. Inst. Tech., with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

There is in Butte, Mont., a young man (32) who has worked in all kinds of metal mines in seven different States for 12 years. He has made a study of mineralogy, geology, surveying and timbering for years, and though he still wears a number 7 1/2 hat, yet thinks he is capable of taking charge of and successfully running a mine. There is no question as to his experience and knowledge, only his executive ability needs demonstration; and he has been "man handled" so long he thinks he is fully capable of doing a little handling on his own account. First-class references. Address "Young Feller," Box 1182, Butte, Mont.

**EXPERIENCED MINING ENGINEER** (43) will leave for Philippines in November. Will accept commissions, and present himself with credentials to reliable parties wishing his services there, after November 1, 1901. Address Supt. M. & M. C. M. & S. Co., Altyn, Montana.

### TO WELL BORERS.

We have six thousand acres of Coal Land to prospect by boring. Who may be interested, communicate with the KNAPP COAL CO., Astoria, Or.

### WANTED IMMEDIATELY. A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop.

Excellent chance for the right man to better his position, if satisfactory. Answer by letter to P. C. JURS, 1109 Van Ness Ave., San Francisco.

### A. M. DONALDSON & CO., Assayers and Waste Product Smelters,

1661 Larimer St., Denver, Colo.  
Pay Cash for Mill Wastes, Iron Amalgam Chips, Gold and Silver Retorts, Old and Surplus Quicksilver, Gold and Silver Wastes. ZINC SHAVING MANUFACTURER. Fresh out always in stock. TELEGRAPH orders solicited.

### BRITISH COLUMBIA MINES.

Mines and prospects in British Columbia and the Northwestern States.  
Free-milling Gold properties on very reasonable terms.

Excellent chance for profitable investment in legitimate mining.  
Correspondence solicited.

Address ANDREW F. ROSENBERGER,  
P. O. Box 700, Nelson, British Columbia.

## Patent Protection.

THE PATENT TITLE & GUARANTEE CO.  
OF NEW YORK,

Protects owners of PATENTS, COPYRIGHTS and TRADE-MARKS against loss or damage from INFRINGEMENT. Send for Circulars. Pacific Coast Office, 508 California St., San Francisco, Cal.

### INVENTORS, Take Notice! L. PETERSON, MODEL MAKER,

644 MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

### Their Own Best Advertisement.

The Sharon Steel Co., Sharon, Pa., have just entered their third order for:

### Cross Oil Filters.

They are their own best advertisement. No trouble to sell the Filter that saves 60% of your oil bills where they have once been used. Shall we send you one on 30 days trial, to be returned at our expense if not satisfactory?

THE BURT MFG. CO.,

Akron, Ohio, U. S. A.

Largest Mfrs. of Oil Filters in the World.

We also make the BURT EXHAUST HEAD.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from G. F. Edwards, in the Philo Haven Consolidated Placer Mine, near Gold Lake, Sierra Co., to deposit tailings in Mud Lake, which drains into Frazier Creek; from the Purdy Creek Mining Co., in the Purdy Creek Mine, near Frenchtown, Yuba Co., to deposit tailings in Purdy Creek; from Edward Bryan, in the Chaparral Hill Gold Gravel Mine, near Onion Valley, Plumas Co., to deposit tailings in Borg Creek; and from the Norwegian Mining Co., in their mine near Toltetown, Tuolumne Co., to deposit tailings in Jackass Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on October 21, 1901, at 1:30 P. M.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

**The
Wilfley
Concentrating
Table**

The most satisfactory concentrating table now in use.
It will give better net returns than any other machine.
It will make a satisfactory saving on the finest slimes or will handle pulp as coarse as 8-mesh to equal advantage.
The Wilfley Table is made only under the personal supervision of the inventor. It is built right and all possible improvements are embodied in the later machines.
Send for circulars describing the latest improved table.

ONCE IN A LIFE TIME
is often enough to do some things. It's often enough
to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON

lasts that long under ordinary conditions. First the life
of a wagon depends upon the wheels. This one is
equipped with our Electric Steel Wheels, with straight
or stagger spokes and wide tires. Wheels any height
from 24 to 60 in. It lasts because tires can't get loose, no
re-setting, hubs can't crack or spokes become loose, fel-
loes can't rot, swell or dry out. Angle steel hounds,
THOUSANDS NOW IN DAILY USE.

Don't buy a wagon until you get our free book, "Farm Savings,"

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. McALLISTER, Acting Secretary.

Office—Room 8, No. 206 Sansome street, San Francisco, California.

DELINQUENT SALE NOTICE.

ETNA PETROLEUM COMPANY.—Principal place of business, San Francisco, California.

Notice.—There is delinquent upon the following described stock, on account of assessment levied on the 22d day of August, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|---------------------|-----------|-------------|----------|
| J. A. Chanslor..... | 7 | 25 | \$250 00 |

And in accordance with law, and an order of the Board of Directors, made on the 22d day of August, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at the office of the company, No. 316 California street, San Francisco, California, on the 14th day of October, 1901, at 2 o'clock P. M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

R. F. MACLEOD, Secretary.

Office—No. 316 California street, San Francisco, California.

ASSESSMENT NOTICES.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1901, an assessment (No. 2) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 56, 120 Sutter Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on MONDAY, the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.

120 Sutter Street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 2) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of September, 1901, an assessment (No. 2) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of August, 1901, an assessment (No. 12) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
HOLLAND SMITH, Secretary.
Office—307 Montgomery street, San Francisco, California.

TANANA MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of September, 1901, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, San Francisco, California.

NOTICE! THE CLOT & CRIST MACHINE CO.,
137-139 Beale St., San Francisco, Cal. Tel. James 1781.
Are manufacturing as a SPECIALTY A FULL LINE of
STEAM PUMPS, MINE SINKING PUMPS, BOILER FEED, DEEP WELL, WINE PUMPS, etc.

W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR
Cyanide and Chlorination Tanks and Vats,
FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling; or for application of second coat, but its full hardness is not attained for some hours as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels. . . . 60 Cents per Gallon;
In Cases. . . . 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

WATER PROBLEM SOLVED

We solve your mine pumping problems. Our engineer makes a personal survey of your property. He listens to all your pumping troubles and takes notes of all the things that the old pump won't do. Then we figure on the conditions. Our long experience enables us to arrive at absolutely correct conclusions. We submit plans and cost. If we get the order we build the pump and install it. If the machine doesn't do the work you don't pay for it, that's all. We guarantee results.

The above illustration shows the method of holding and sighting BRUN-
TON'S PAT. POCKET MINE TRANSIT.
When taking courses or horizontal
angles. The construction is such as to
permit of simultaneous sighting and
reading. No tripod or Jacob's staff is
necessary, and an operator, after be-
coming accustomed to its uses, can
take the Transit from his pocket, take
a reading and replace the instrument
before a sighting compass can be
placed. The most accurate and reli-
able pocket instrument on the market.

"BRAUN'S SPECIALTIES."

MODERN APPLIANCES FOR ASSAYING.

Prepare Your Roofs for Winter.

Now is the time to prepare your roofs for the winter rains—for the heavy storms that are bound to come and sure to leak through all imperfect roofing.

If your building is covered with P & B Ready Roofing you need not care for rain, snow, or tempest. It will not leak nor be affected in the least, for P & B Ready Roofing is a perfect roofing and will always protect your building from the elements.

As P & B Ready Roofing comes in rolls you can cover a large surface quickly—it is easily transported and at low freight rates.

Send for booklet, giving full information—address Department A.

Paraffine Paint Co., 116 Battery St., S. F.

THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.
Will take ore from finest mesh up to 6-mesh without sizing.
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD.
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

Prospecting Machinery.

Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything; brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 850 Frue Vanners, one man attends 48 machines for 12-hour shift.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.

" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Eastern and Western Nevada.

Nevada in 1901 is receiving a renewal of the exploration and exploitation activity of the early '60s. In this all sections of the State seem participating. Names of places that one could conjure with in the old days, are again familiar, and again mean the promise of great mineral production, and new names are fast getting the significance the older ones have.

White Pine county, in the extreme east of the State, to the old miners will recall silver mines of vast riches, with their wealth close to the surface in easily reducible ores. Ely, Hamilton and Osceola were great camps once and may become even greater camps again. The illustrations of Ely and White Pine county scenes on this page are views taken just about the beginning of the new industrial life that may fast build the places out of their old recollections. Utah miners, with the money they have made in the mines of their home State, have lately been crossing the line into White Pine county in increasing numbers. Quite a number of old properties have been taken up by them, and the

possibilities are for more fortunes in the gold and copper the old miners left behind than in the silver they took with them. Many causes are contributing under the surface to this new attractiveness of White Pine mines. They may all be comprehended in the one word "availability." The minerals were long since known to exist. Now they have become mines, because now available. The processes of reduction of ores have simplified and cheapened in the interval. The transportation facilities have increased and cheapened and the metals sell for more than they used to.

Western Nevada has not been behind in receiving the same impulse toward increased mining activity. Mason Valley in Lyon

county, than which nothing, to judge from the illustration on this page, could seem more fitted for the home of the jack-rabbit and the coyote, is discovered to be a region of considerable possibilities in copper mining. Quite a number of large operations have been started by Eastern and Montana capital largely.

Smelters have been built and put in blast and copper made. In the vicinity of the county seat—Dayton—there has been a revival of work in gold mines, which, but for the nearness of the Comstock, would long since have been largely developed.

Wood drives on the Carson river have been very closely associated with western Nevada mining. The Comstock region never contained much timber, and the near-by growth that could be used was early exhausted. Among other localities drawn on for wood, for fuel principally, were the forests in the headwaters of Carson river, in Douglas county, Nevada, and Alpine county, California. The wood cut there was floated the

Typical View in Western Nevada.

Scenes in White Pine County, Nevada.

first stage of its journey in "V" flumes, and then in the Carson river to booms by the stamp mills and railroads. These forests, too, have been almost completely used up by the mines. The power for the machinery that they furnished used as fuel now comes from water. Not the water of Carson river, which may later be so utilized, but the water of Truckee river has been harnessed into electric generation and transmission plants, and is made to do the work at Virginia City on the Comstock and at Reno on the new mines under development there. Walker river flows through Mason Valley, and it is quite within the possibilities to foresee the time when its flow in the upper mountain sections shall be utilized by power plants to do the work of mines in Mason Valley. White Pine county unfortunately has no such possibilities of cheap transmittable power. Its opportunities can, however, be made more valuable by the better railroad facilities through the projected extension of the road now ending at Eureka to Ely. This is only waiting on a determination of the extent of the copper ore bodies.

Personal; Recently Declared Mining Dividends; Commercial Paragraphs; New Patents; Notices of Recent Patents, 156.

MINERS in the Kougark district, near Nome, report finding evidences of ancient working of some of the placers. The constructions they report finding—a coffer dam and bed rock drain, built with stone walls—are characteristic of Russian mining in Siberia. There is nothing improbable in the theory that the mining was done by the Russians.

THE California State Railroad Commission have rendered a decision in the case of the petroleum rate from the Kern river field. The findings of the majority are (1) that the existing rate of 42 cents a barrel is unreasonable, (2) that the cost of carriage of the petroleum is 33.5 cents a barrel from Bakersfield, and (3) that 37.8 cents a barrel is a reasonable rate. They have ordered that the last named figure be put into force after November 1. Commissioner Blackstock dissents from these findings, holding that the evidence showed the present rate to be reasonable. Petroleum shippers are not satisfied with the reduction, claiming that it is too little. Their contention would seem to be sustained by the facts, even if the evidence offered, as the dissenting commissioner claims, fails to sustain them throughout.

In another column appears a paper on the possibilities of cement manufacture in California by A. H. Cederberg. Attempts have been made in California to make cement that have not been commercial successes. Most of these are some years past now, and commercial conditions have changed. Methods and machinery for making cement have been improved by American manufacturers in the Eastern States. The cost of fuel has decreased in California through the development of petroleum. Uses for cement have enormously expanded. At the same time the price of imported foreign cement has not decreased. The opening for capital should not be overlooked. There is business even now for more works than at present projected. Lowered prices which local production would bring would increase consumption, and there is certain to be in a very few years a market for enormous quantities in the construction of the Nicaragua Canal. The estimates of construction call for 20,000,000 barrels. Inasmuch as the larger portion of it would be required at the Pacific end of the canal for harbor and lock construction, manufacture in California or elsewhere on the Pacific coast should be past the stage of experiments before the demand comes. The transportation costs favor the making of the cement on this coast; but it may be counted on as a certainty that the engineers in charge of the canal construction will not accept it on that account. The cement must have proved its value in comparison with Eastern cement before it will be considered.

The California State Miners' Association.

Ten years ago this month the meeting of Placer county, California, miners was held in Auburn, Cal., which called the first State convention of what is now the California State Miners' Association. On the 21st inst. that Association will hold its tenth annual meeting in San Francisco, Cal.

Of its kind the Association is the only one. There have been and are now mine owners' associations, organized and operating to subserve special business purposes more or less local. Miners' labor unions are common as associations of miners whose occupation consists in doing mining work for wages or on contract. Boards of trade and merchants' associations have a limited field of membership, and provide for certain public activities more localized than otherwise.

The California State Miners' Association has the unique distinction of being an organization inclusive of the objects of organization and personnel of membership of all of the others. It is composed of mine owners, miners who work for wages, the business people of the mining communities, and the merchants and manufacturers of San Francisco and other large commercial and industrial centers of population.

The Association was founded, in the first instance, on the community of interest principle. Mine owner, mine worker, local storekeeper, city merchant and manufacturer recognized their mutuality of interest in the gold in the mines which made possible the mining industry. The mine and the men who worked in the mines were recognized as the essential elements in the providing of gold to be divided among all. Unless the mines could be permitted to operate, and under conditions which would pay the mine owner and the mine worker, no one could have any of the gold.

This community of interest of all California people was discovered when the great gold producers of the State—the hydraulic mines—were all closed down by injunctions as a result of debris flow into the Sacramento valley, and at the time when the railroad was endeavoring to obtain wholesale, under its grant, the mineral lands which were specifically excluded from it. The work the Association set out to accomplish, the rebuilding of the hydraulic mining industry and the preservation of the public mineral lands as such, has in the ten years been so far accomplished that completion is largely a matter of detail. Many of the hydraulic mines have resumed operations and others wait on the construction of debris dams, for which the plans are made and the money for construction ready.

The quick response to the community of interest idea, which made the organization of the California State Miners' Association possible, and the clear comprehension of the meaning of the idea which has kept the organization within the lines on which it started, have more than a local and passing interest. Largely they are the growth of the exceptional social and industrial conditions connected with California gold mining. The mines are very largely owned in the local mining communities by men who have made them by working in them. Mine owners and mine workers are not two classes, such as are defined by capitalist and laborer, but are of one class, social equals always, and only temporarily different in the amount of money possessed. The mine owner and the mine worker can, and often do, change places without loss of mutual respect. As a consequence, it is easy for them to unite and pull together, for each mine owner and mine worker knows that he is pulling for himself. Local storekeepers, city merchants and manufacturers have for the larger number at some or other time in the past been California mine owners and California miners. In the Association they have always been with their own. The social and industrial peace that the unity of associations and interests have brought should be maintained here and sought in communities less favored.

The Association meets this year with its history in the ten years that are past. Its main purposes are being accomplished. Lesser ends, such as the obtaining of a national department of mining and the revision of the mining laws, are in the keeping of mighty forces, which here we may inspire but cannot control. New York is re-

organizing mining now, and will have or not have a Secretary of Mines. Senator Stewart is still young, and revision of mining law must wait on his death, when it may be that there shall not be any necessity for the revision.

Assay Returns.

The Los Angeles, Cal., correspondent who writes referring to the editorial in this paper on "Assay Returns" on September 14 is inaccurate in the quotation he makes the basis of a criticism. This paper did not say "that assayers should have a blank form for all kinds of tests, or returns." What it did say was, "There should be one general blank form which would be used for all assay returns, partial or complete." "All kinds of tests, or returns," is not the same idea that is conveyed by "assay returns." The latter has just one meaning, namely, the dollars of value in a unit quantity of the particular mineral or rock questioned. "Tests," to give the word the meaning our correspondent has in mind, means trial examinations of processes for getting the dollars of value out of the particular mineral with a commercial profit, after, by having "assay returns," becoming informed that there were dollars in value to get out.

The making of all kinds of tests is not the business of an ordinary assayer. An assayer may make such tests, but when he does he is not an assayer, but an "expert metallurgist"—not the daily newspaper kind of expert, produced by a lead pencil, but a specialist of the highest class. An assayer may give street opinions, advising a client for whom he has made assays as to processes. Receiving nothing for street opinions, he assumes no responsibility for their correctness. As a fact, such opinions—or, indeed, opinions at all—should only be regarded as suggestive of the direction of initial tests.

Assaying is largely a mechanical operation and some assayers are merely trained to perform the operation. Their work is only expected to answer the question, "How many dollars of value in a unit measure of this mineral?" It is not absolutely unreasonable to assume that the advance of adaptation of mechanical devices to the mechanical part of metallurgy will some time give us machine assaying; a machine into which one can feed the questioned (or questionable) mineral through one slot, a nickel in another, then press a button somewhere, and from a third draw down a blank with assay returns typewritten on it.

The purpose of the editorial which has attracted our correspondent's notice is to standardize assay returns, and aid efficient assayers.

An engineering construction of great commercial interest is reported as having been revived by the Russian Government, which will now undertake the construction of the section of the first located line of the Transsiberian Railroad, following the Shilka and Amur rivers between Stretinsk and Havarovka. This route was abandoned when the shorter Trans-Manchurian line or cutoff, which has been partially constructed, was first projected. During the late Chinese war a large section of this last line was destroyed by the Chinese, but is now being rebuilt. The building of the Amur river line can hardly fail to mean an enormous consumption of structural material from the United States. It can also be expected to have a most stimulating effect on the several propositions, more or less in the formative stage, to manufacture iron and steel on the Pacific coast. By far the cheapest transportation to the place of use of steel and iron is from the Northwest Pacific coast to the mouth of the Amur river at the port of Nickolleff, and thence to distribution by river steamers. The steel can be brought from Russia by the already constructed railroad to Stretinsk, or by steamer via the Suez canal to Nickolleff, but both these routes are long and costly compared to the short Trans-Pacific. Ten years ago a great deal of faith—for there was little that could be considered evidence—was necessary to foresee the development of a great iron and steel industry on the Pacific coast. Now it would create no surprise if the announcement were made any time that the United Steel Co. would immediately construct a great steel making plant in Alaska, or if some great English firm should undertake a similar enterprise in British Columbia.

Concentrates.

WITH a charge of ten tons of slack coal to a coking oven the product is 68% to 75% in coke, dependent on whether or not the coal was washed.

GRAND RIVER, the eastern branch of the Colorado river in Colorado, is the farthest east of any stream whose waters flow into the Pacific ocean.

AN agreement on a common boundary line by one co-owner in a claim does not bind the other co-owners. The reason of this is that co-owners in a mining claim are not partners.

THE production of aluminum in the United States has increased from 150,000 pounds in 1891 to 5,200,000 pounds in 1900. The price dropped from 66½ cents a pound to 32 cents during the same period.

AN alloy of nickel and steel, containing 25% of nickel, both constituents being highly magnetic, is almost entirely non-magnetic. But by great and rapid cooling of the alloy it may be made magnetic.

THE gold receipts for the first quarter of the fiscal year at the United States assay office at Seattle were \$1,874,312, a deficiency over last year's receipts for the corresponding period of almost \$7,000,000.

NICKEL STEEL ALLOYS containing about 25% of nickel have remarkable tenacity, up to 142,000 pounds to the square inch, and have remarkable resistance to injury under rupturing strains that other steels yield to.

THE State laws relating to corporation proceedings should be carefully complied with. Where the laws require the consent of the stockholders to the execution of a paper the records of the corporation should show that the consent was given.

THE Australian blue gum tree wood seasoned will make good mine timbers. The wood is stronger than pine and much less liable to decay. It is notable that, used as piling, the teredo, which by boring rapidly destroys fir piles, leaves it untouched.

THE effect of swelling ground in the tunnels of drift mines in California is compensated for by spreading the timbers at the floor. Whenever the swelling starts to break the side lagging or raises the tunnel floor the rock is cut away, restoring the opening to its original dimensions.

AT the copper mines of Ashio, Japan, the ore is almost entirely a copper sulphide carrying about 19% copper. The total output of sorted ore is about 100 tons daily. The ore is reduced at the mines in brick reverberatory furnaces, using wood for fuel, and in blast furnaces, using charcoal fuel.

A LATE method of water-wheel regulation where several wheels are used for electric power development, which is put on the same transmission line, consists in leaving the water gates fixed and regulating by adjusting resistances in circuit with the dynamos so that the load on each is equalized.

THE statute of May 14, 1898, extending the homestead laws to Alaska is inoperative because the public surveys have not yet been made. The only way in which titles can be granted so far is under the mineral, trading and manufacturing and town site claims, and exercise of soldiers' additional homestead rights.

IF aluminum bronze contains less than 5% of aluminum, tin solder can be used to solder it. If over 5%, a good solder consists of 20% zinc and 15% cadmium. The surfaces are cleaned, a first and second layer of solder is laid on, the excess is removed with a brass scratch brush and the pieces are then soldered as usual.

IN one of the recent trials in Butte, Mont., representatives of the Boston & Montana M. Co. testified to copper ore smelting costs being \$4.78 a ton, while representatives of the Montana Ore Purchasing Co. contended that the cost averaged \$7 per ton, submitting a table said to be made up of the exact costs for a period of ten months.

A SLUICE HEAD of water, as understood by the old miners, was variously 35 to 40 miner's inches. It gave a supply that would fill a sluice box made of 12-inch boards, when the sluice was set on a grade of 10 inches to a 12-foot box length and was having shoveled into it the gravel that the water would wash away without slumping.

AT 5000 feet elevation a siphon can be arranged to clear a slope of water to a vertical depth of 12 feet. Hand pumping that could not hold the water down with 30 feet lift should be able to hold it with only 18 feet lift. The combination suggested is, however, only a temporary expedient. Any power is cheaper in the long run than hand power.

WHILE persons resident in forest reserves, who have not a sufficient supply of timber on their own claims for firewood, fencing, building or mining, may remove without charge timber for their own use for these purposes, application must be made to and permission given first by the Interior Department where the value of the stumpage exceeds \$100.

THE metric system is in compulsory use in twenty countries with 300,000,000 people; the English system in only two, England including some colonies and the United States, with 150,000,000 people. The objection that the metric system would have to be learned is trifling. The 300,000,000 have had to learn it. It might be taken on the installment plan. The measure for liquids could be easily introduced. The litre and quart

are so close together that the change of measure could be made without attracting attention unless the name metric was attached to it. The metric weights already have a foothold in chemistry and assaying.

THE "latest" in cyanide process development is understood to be a method recently patented by the Gold and Silver Extraction Co. of America, Ltd., for recovering the cyanide of potassium that is apparently consumed by copper and iron salts during the treatment of ores containing these constituents. Cyanide consumption in such cases is usually high.

WHILE the period of newspaper publication of an application for patent to a mining claim requires ten publications in a weekly newspaper, thus including sixty-three days, counting the first and the last, the period during which an adverse claim can be filed, the Land Office has ruled, is the exact sixty days allowed by the statute, beginning with the first publication.

THE fact that a particular gold-saving device will save all the fine gold from sand and fine gravel is not so exceptional as inventors are apt to believe. Sand is very much the most favorable material from which to get out all the gold by washing. The real test is with gold in clay. Try the machine on a moderately compact clay and see how much or how little of the gold it gets out.

ABOUT sixty pounds of the coal in coking with by-product ovens becomes coal tar, and about 10% of the coal tar is aniline dye chemicals. The yield of ammonia sulphate from each ton of coal is about twenty pounds, worth 1 cent a pound. The coal tar is worth ½ of a cent a pound. The by-product ovens produce from 15% to 20% more coke from the coal than the old style beehive ovens.

ASSESSMENT WORK on connecting and contiguous claims under the same ownership can be done on any one of the claims if manifestly tending to develop the entire group. Such assessment work must aggregate \$100 for each claim. That is, if a man own say four claims there must be \$400 annual assessment work done to hold them, either \$100 on each one or \$400 on any one of the four.

THE Secretary of the Interior has confirmed the report of the Commissioner of the General Land Office on the petition of Alaska residents to have the location of the land office and Surveyor General's office at Sitka changed to Juneau. The prayer of the petitioners is refused, principally on the ground of economy to the Government. The difference in office rent is \$250 a year in favor of Sitka.

IT is difficult to determine just which is "the banner town of the country for subscriptions to the MINING AND SCIENTIFIC PRESS." Probably Tonopah, Nevada, comes as near the top of the list in this respect as any. Out of a population of 750, there are 110 paid subscriptions. Since July 1, 1901, the names of 617 new subscribers have been received from various parts of this west half of America.

THE general course of the price of silver has been downward since the beginning of the year, when it was 64 cents. In April it was 58½ cents and at the present time is 58 cents. The production in the United States has not changed much during the last ten years. In 1891 it was 58,330,000 troy ounces; in 1900, 59,610,543 ounces; and the average annual production for the period was 56,856,600 ounces.

TO WELD COPPER, treat it first with a solution of nitrate of potassium and a cyanide. It can then be welded either to itself or to iron or steel in the ordinary way used in welding iron or steel. A clean fire of coke or charcoal and a temperature of the copper much below white heat will insure the best result. A higher temperature makes the metal brittle in working, and one too low will not give sufficient fluidity to the flux.

THE railroad from Reno to Virginia City, Nev., during the bonanza days of the Comstock made the largest earnings of any railroad in the world. The White Pass & Yukon from Skagway, Alaska, to White Horse, B. C., is now rivaling its record. It pays 20% dividends and expects to pay 25%. Freight charges are \$120 a ton. Its prosperity can not be taken as the measure of what can be anticipated from the project to unite by rail Dawson in the Yukon and Irkutsk in central Siberia.

IN using sulphur to assist in welding operations the sulphur is sprinkled into the fire before the metals are placed in it and brought to a welding heat. The action of the sulphur seems to be to clean the fire, or the metals, or both, of impurities which usually make welding difficult. By first treating the fire with sulphur before bringing the metals to a welding heat, copper, brass and other metals can be welded as well as iron or steel. About a full tablespoonful of powdered sulphur suffices for one welding operation. The process is the subject of a late patent.

THE overflowing of levees on the Sacramento and San Joaquin rivers in California is not caused by the filling up of the beds by hydraulic mining debris. This cause undoubtedly affects the elevation of the beds of the Feather and Yuba rivers, branches of the Sacramento. The low-water plane of the water flow in the main rivers is very much the same as before mining started and before levees were built. The cause of the overflow is in the construction of the levees themselves. The confining of flood stages of flow in the narrow limits of the levees raises the plane of the flood stages and overtops levees built without taking this into account.

WHERE the getting of lumber in place for a ditch flume is impracticable, there are at least two forms of alternative construction possible. A flume can be made of puncheons or even of poles. These are fastened by wooden pins to flume sills and posts set closer together than when using lumber. The cracks are tightly packed with moss and sediment is run in to make the conduit a better water holder. This method of construction is common in Siberia and is employed in some localities in Alaska. A preferable alternative construction is made by building up a floor grade for the water flow with large boulders and slabs of rock with the openings filled with gravel and clay or earth. The latter is puddled in as the structure is built up. Sides, or rather one side, the outer—the hill slope against which the ditch is built making the other side—are rock walls laid up or puddled in clay or earth in a similar fashion to the bottom. Running muddy water through this ditch for a while makes the bottom of sides watertight. It is necessary to build such ditches on a flat grade so that the water flow takes a low velocity, depositing silt instead of picking it up. There is little pressure on the walls from the water and there are many examples in California of the construction described that have been in continuous use with little repair for nearly a half century.

AN undercurrent is a device for saving fine gold in placer mining. Reference is intended to the type of construction rather than the particular construction associated with hydraulic mining, from which the name undercurrent was evolved. As used in hydraulic mining, it is not a perfect saver of fine gold, though it recovers much that passes the sluices, and very likely nearly all that is free from attachment to particles of clay or other rock. Where not used to handle such large quantities of material and water as in hydraulic mining, it is possible to make the undercurrent a much more efficient saver of fine gold. The undercurrent, if small, such as would be used on a dredger, for example, can be set so that its grade can be exactly controlled. The pulp fed should be screened to as near uniformity as practicable and must flow in a thin, even stream over the riffles. In the latter the water flow should keep the sand quick and free from the condition termed "sanding," where the material becomes tightly packed in the riffles. In this last condition fine gold particles slide over the riffles in the tails. With the sand "quick," the fine gold particles sink into it and are caught by the riffles. It is desirable to have a rod mounted in guides over the undercurrent, with small paddles or stirrers, which can be worked through the sand in the riffles to break up any tendency to sand. The usual manner of setting the cross riffles, the only kind that should be used in an undercurrent, is to place them on edge perpendicular to the bottom of the undercurrent. A very much preferable way is to set them vertical, with top and bottom faced parallel to the bottom of the undercurrent. This gives them a rhomboidal form. The inclination against the pulp flow provides a pocket or dead-water angle, into which the fine gold collects and is not moved out by the in-and-out dipping of the water current. With this form of riffle construction quicksilver is rarely needed to collect and hold the finest flour gold.

THE exact numerical relation between the entry head, the velocity head and the friction head of water flow in pipes is sometimes misunderstood as a result of too close mental dependence on the language of textbooks. The three heads together make the total head, or difference of elevation, between the surface of the water at the inlet end of the pipe and the center of the outlet end of the pipe. The entry head is that portion of the total head which overcomes the resistance to entry of the water and keeps the pipes full. Experiments have determined this to be practically one-half the velocity head. The velocity head is the difference in elevation in vacuo the water must fall through to get the velocity with which it actually flows in the pipe. The friction head is the amount of fall required to overcome the internal resistance of the pipe to the water flow. The entry and friction heads thus balance resistance and the velocity head moves the water. Resistances increase in the ratio of the square of the velocity; consequently, the portion of the total head required for friction head increases with the square of the velocity. The velocity head only increases directly as the velocity. It happens, therefore, that in the free discharge of long pipes, the discharge through the full cross-sectional area, the friction head amounts to nearly all of the total head. Textbooks, commenting on this, state that the sum of the entry and velocity heads rarely exceeds 1 foot. With suppressed discharge, or discharge through an orifice smaller than the full cross-section of the pipe, the relation of the three heads, considered with reference to the water being discharged, changes, the velocity head becoming much the larger portion of the total head. The entry head is lessened and becomes very small, and the friction head becomes relatively small. With a sufficiently small discharge opening, the velocity head will approximate to the total head, the other two becoming eliminated. It must not be forgotten that the basis for these figures is the quantity of water discharged. Practically, the pipe becomes in its relation to the discharge opening a tank or reservoir. With water power installations it is desirable to reach as close as possible the condition in which the velocity head is the total head. The friction head and the entry head are losses which deduct from efficiency. The pipe must then be larger in diameter, relatively, to the discharge opening, in order to reduce velocity of flow in it, and thus reduce the loss by friction head.

Possibilities for Portland Cement Manufacture on the Pacific Coast.

Written for the MINING AND SCIENTIFIC PRESS by
A. H. CEDERBERG, C. E.

In a recent publication my attention was called to the fact that enormous quantities of Portland cement were being imported every year on this coast, one city alone contributing with an amount of 525,000 barrels of cement in one year, and that the present conditions called for an increase in imports rather than decrease. This notwithstanding that the cost per barrel of the imported cement is more than double that on the east coast, where American Portland cement can now be bought for \$1 or less a barrel in bulk at the mill.

The prevailing opinion on the west coast is that none but German Portland cement is worth while considering. This is an opinion which at one time was held in the East, but not held now. The American Portland cements are not one but many brands, and are known to be superior to any foreign Portland cement made.

The United States Government engineers and the American Society of Civil Engineers have officially declared the superiority of the home made article. Six years ago very little domestic cement was used, or even manufactured, while to-day we manufacture at the rate of at least 10,000,000 barrels a year, 80% of which is made within a radius of 25 miles in the Lehigh district, Pennsylvania. The largest consumers are the railroads and the municipalities, and were it not for the high prices on this coast the increase in the use of Portland cement would without question be enormously extended within a very short time. The importing dealers in the foreign cements naturally assert superiority on the uniformity shown by the physical tests of the foreign brands. While the uniformity exists, the claim of superiority is untrue. The physical tests of American made Portland cements show equal uniformity and a higher figure of uniformity. The writer knows of no manufacturers, either in the United States or in Europe, that take such pains and care in the making and testing of every barrel of cement sold as the Lehigh makers of certain brands. A tester of these brands must acknowledge not only the physical uniformity, but also their undisputed superiority to anything made either at home or abroad.

The reason for this superiority of the leading home brands is not so much due to quality of the raw materials as it is to the superior mechanical devices adopted in their respective plants, chief among which must be mentioned, first, the rotary kiln system, originated by Ransome in England, but developed here; second, superior calcining and grinding devices; third, more practical physical and chemical testing.

How important these three items are can be readily appreciated. The raw materials in the Lehigh valley district are practically the same, chemically; nevertheless, the product manufactured at the various plants differs radically, especially on physical testing, while the chemical analysis shows up very uniform. Chemistry plays a small part in making a high-grade Portland cement, when compared to the physical properties, which are the result of superior mechanical devices in treating the product, whether raw or burned. A cement chemist always surrounds himself with more or less mystery, while as a fact the part of chemistry is unimportant contrasted with the more vital physical treatment required to manufacture the cement.

The argument has been put forth that cost of fuel and labor on the Pacific coast is a factor adverse to the economical manufacture of Portland cement. I will admit that the cost quality of coal, plus cost of local labor, would undoubtedly increase the cost of manufacture at least 27 cents per barrel more than in the East, coal being here figured at \$5 per ton and labor at \$3.50 and \$2.50, respectively. On the other hand, crude oil in such quantity as to equal in heat units one ton of best slack coal can be had here for \$2.80—present market price, which is only 25 cents higher than one ton of best Virginia slack delivered at the cement mills in the Lehigh valley district. Add to this the fact that crushing and pulverizing of coal would by the use of crude oil be eliminated, the difference in manufacturing cost would be only in cost of labor; and even here much saving could be accomplished by means of skillful engineering in applying mechanical devices to handle the material. Hence, in my opinion, the cost of manufacture here should under no circumstances be more than 10 cents per barrel higher than in the East.

California is at present very little represented in the cement manufacturing industry. There is in operation one small factory at Colton. Another is now under construction at Suisun, and a third one is under consideration, also in the latter place. While the raw materials are chemically correct for the making of cement in these places, they are, however, not all the best from a mechanical standpoint, a fact which is very seldom taken into consideration. For reasons appreciated by constructing

cement engineers, cement made of materials not the best cannot reach the same standard of excellence developed in the leading brands of the East. California has, however, enormous deposits of limestone and slate rock of the finest quality, and which from the important mechanical point of view would be free from all possible objectionable features. The California limestone seems to be unusually free from carbonate of magnesia, which is an economical advantage of no small importance, especially in the burning process, and there is not the slightest doubt in the mind of the writer that high-grade Portland cement manufactured of such raw materials could be sold at a large profit for \$1.25@1.50 in bulk f. o. b. car at the mill.

The construction of a modern cement mill of 1000 barrels daily capacity, equipped with the best of machinery, costs about \$500,000. The best machinery in the market for grinding purposes is the so-called Griffin mill, with which the Lehigh Portland Cement Co.'s works have had good success, and the ball and tube mills, which have met with marked success in the Alpha, Vulcanite, Lawrence and Whitehall works. The writer is more in favor of the ball and tube mill system, he believing it to be a cheaper one in cost of maintenance.

The size of the mill is important. A mill of 500 barrels capacity is too expensive, the labor bringing the cost up too high. A 1500 or 2000-barrel mill is an economical one compared to a 500-barrel plant, because administration and labor are nominally no higher in either instance.

A 1500 or 2000-barrel plant will cost on the coast about \$600,000 or \$800,000, and require a starting capital, when operation of the plant begins, of at least \$100,000. A cement plant is of enormous profit to the railroads, and for that reason they could be depended on to give any reasonable concessions in the way of freight tariffs, yard facilities, etc., in order to have the pecuniary benefit of handling the increased cement transportation which lower first cost would inevitably bring about.

The Impending Shortage in Platinum Supply.

A law has been proposed in the German Reichstag prohibiting the use of platinum where it can be replaced without serious inconvenience by some other metal, and to limit its consumption to cases where its employment is essential. A writer, discussing the proposed law, warns against the danger of an impending platinum famine. The debate on the bill in the German Reichstag, he says, struck a note of warning regarding an imminent danger, the full importance of which appears not to be fully realized even among those who ought to be most concerned, but the restriction of the use of platinum in one country alone is hardly a practical measure for averting the dreaded consequence of a platinum famine. The problem, he suggests, is one of those that are eminently fitted for an international agreement, and should be carefully investigated by a commission composed of experts from all civilized countries.

On the many uses to which platinum is put, the writer points out the important part it plays in modern industries, although its extensive employment is only of recent origin. Thus, in the great chemical manufacturing processes there are operations in which it is practically indispensable, as, for instance, that of purifying acid, for which platinum retorts are used—each of which frequently represents a value of \$10,000 or more—or various operations on which the accuracy of chemical analysis depends. Even more important is the use of platinum in electrical engineering processes, and in the manufacture of electrical apparatus. Also, as is well known, this metal has a very important function in incandescent lamps. It is, in fact, the only metal known around which glass can be fused. If it be added that it withstands abnormally high temperatures, and that no acids, excepting aqua regia, will attack it, it is easily comprehended that, unless a substitute combining these qualities be discovered, the exhaustion of its supply would have a serious effect upon more than one industry.—Electrical Engineer, London.

At Rouen, France, the chief of the fire department has submitted a proposal to the municipal authorities on the subject of utilizing the tramway trolley wires in connection with the extinguishing of fires. All the principal thoroughfares of the town are provided with electric tramways, and the proposal is that pumps capable of being electrically driven should be installed in a number of suitable positions on the tramway route, to be switched on to the trolley wires, so that the pumps can be used as occasion necessitates. The proposal is said to have been favorably received and is now under the consideration of the authorities.

It is said that the method of fusing the materials for glass manufacture on a hearth by electricity is giving very promising results. The sand, cullet and other substances are fed on to the hearth continuously by an archimedean screw, and the arc is produced by a direct current of fifty volts, but an alternating current can also be used. Considering the low voltage used, the fusion should be very economical, and especially so when the dynamos are water driven.

Gold Mining in the Rossland District, British Columbia.*

By J. J. SANDEMAN.

Rossland, B. C., is situated in the West Kootenay district, and from a geological and mineral point of view it forms a study of great interest. The present site of the town of Rossland was at one time the crater of a volcano from which lava and ashes deluged the surrounding country. The variety of igneous material which covers the district seems to intimate that the eruptions were intermittent and that the volcano itself was of great age. The occasional presence of quartzite or metamorphosed sandstone seems to indicate that a shallow sea existed here, previous to the volcanic outbreak. The district may be roughly described as an area of gabbro, surrounded by quartz-diorite so highly metamorphosed that the contacts are very distinctly defined. The gabbro area, though only about 1½ mile wide, by 4 or 5 miles in length, is one of great importance to the district; for it is in the gabbro, or closely bordering it, that the best mines have been discovered. The Gertrude mine appears to be the only exception from this rule, for 200 feet below the surface the top of a gabbro dyke has intruded and scattered what had promised to be a fine body of ore.

Many erroneous local conjectures have been made about the age of this district. Fossils have been found which geologists declare belong to the Carboniferous period; these, however, serve only to prove that at some time the Carboniferous strata had overlain the present igneous rocks and had been subsequently removed, probably by glacial agencies. The writer has, so far, been unable to obtain any data proving that the fossils have been found in any other location than near the surface or in the upper part of fissures.

Another local controversy has greater justification, and this difference of opinion is in regard to the nature of the faulting which has so much disturbed and contorted the district. Compression, or the shear-zone theory, and elevation and depression have each their supporters. But any engineer who strictly adheres to either theory will soon find himself at fault in more senses than one, for each has been controverted by practical experience. In the writer's opinion, the complex faulting is owing to the following historic sequence of geology: This district, in conjunction with the rest of the Pacific coast, has been subjected to a great upheaval with consequent faults and general weakening of the surface crust. A great thrust from the west probably started the volcanic activity, and the enormous mass of igneous material, removed from below and precipitated on the surface, reduced the support and greatly increased the weight—hence a general subsidence took place, with its accompanying normal faults. The cooling of this great mass caused shrinkage and depression and has caused some of the shear-zone phenomena; but the consequent parallel fissures and reversed faults have been intersected and cut off by previous faulting.

The veins are true fissure veins, the metal in them being the result of metalliferous liquids flowing through them, attacking the country rock on each side, dissolving the rock and gradually replacing it with metallic sulphides. Such being the case, the shoots of ore often fade away into the surrounding country rock, and, there being no well defined walls, the ore is frequently lost. This, with the very irregular width of the veins and their complex faulting, renders Rossland geology an exceedingly difficult problem to mining engineers. Yet, the writer has proved by actual practice that these difficulties may be overcome by careful study; but the conservative mining engineer with fixed ideas, formed from experience in other districts, would soon convert a mine into a worthless hole in the ground.

The principal ores are chalcopyrite and pyrrhotite carrying various percentages of gold, silver, copper and bismuth; but although some ore will run to a total value of \$50 per ton, the majority is of so low a grade that only the abundant facilities of transportation and the comparatively low cost of smelting would justify mining in such a country.

The diorite formation is intensely hard and expensive to work, but fortunately the water is easily handled. Electricity is the motive power, the West Kootenay Company supplying by cable transmission power to run the dynamos at the mines at a cost about 50% less than the same work could be done by steam; this, with the various works lighted by electricity, gives the district a very businesslike appearance, and the surrounding mountains, with their railroads and self-acting trans tipping into the railroad trucks, all bear evidence of practical and economical work.

As it is possible that members of the Institute might be in a somewhat similar district to this, the writer will point out a few matters that might be of use. First, where chalcopyrite changes into pyrrhotite the continuation of the ore is pretty well assured; on the other hand, where pyrrhotite changes into chalcopyrite, it is likely soon to scatter out among the enclosing rocks. When a lode gives out and leaves no visible trace, small and sometimes almost

*Proceedings Inst. Min. Eng., Newcastle-on-Tyne.

invisible streaks of calcite frequently follow the strike of the lode or run parallel with it. Once, by following one of these streaks a few feet and then crosscutting, the writer found ore where it would otherwise have been certainly missed. The inflow of water in underground workings is no sign of vicinity to a lode, but rather the reverse. Where water proves troublesome, a crosscut intersecting the water flow and conducting it to the nearest fault line will sometimes act as a drain and save much hoisting. Where the gangue of a lode becomes siliceous, the quartz, though apparently worthless, frequently monopolizes all the gold values. The more valuable quartz is clouded by a dark-gray substance; these stains are probably caused by some form of petzite; this, however, is merely a surmise, for the quartz on assay yields no trace of tellurium.

Tunnel Through Sand, Under the River Spree, at Berlin.

A tunnel for a tramway under the river Spree, at Berlin, is driven through mud and sand heavily charged with water. The total length is 2017.2 feet, of which 1490.3 feet are tunnel proper; the grade of the tunnel lies 39.36 feet below the main level of the river, and the least thickness of soil between the top of the tunnel and the bottom of the Spree is about 10 feet.

The tunnel is formed of a cast steel cylindrical shell 4 m., or 13.12 feet, in diameter, made in rings and covered with cement mortar both inside and outside. The exterior layer of mortar is 3½ inches thick, and the inside layer 4½ inches thick. At the bottom of the tunnel is a concrete floor, carrying the rails, and also a drain for taking away any water that may filter into the tunnel. The cylinder rings are 2.13 and 1.64 feet wide; and they are each made of nine plates fitted on all four sides of each plate with inside flanges for bolting together. Between these rings, during erection, flat steel circles are bolted, projecting outward and thus increasing the rigidity of the metallic tube.

The actual excavation is done with an advancing shield and under compressed air. The shield is made of a double, transverse bulkhead, enveloped in a cylindrical hood; the front of this hood being cut away on an angle of 45° to protect the men at work. As shown in the illustration, this hood is closed on

the oblique front by a metal covering, provided with hinged doors, which may be opened at will. The material removed through these doors is thrown into the bottom part of the hood, and is then removed by a sand pump, with its pipes passing through the transverse bulkhead at the bottom. This advance hood is closed in the upper part, so that a space filled with air is left as a refuge for the workmen in the case of a sudden inflow of sand and water. For the same purpose the air lock is placed in the bulkhead which separates the working chamber from the space to the rear of the shield in which the rings are being built up.

The actual construction chamber, in the rear of the shield, is included between the front transverse bulkheads, and a temporary transverse wall of masonry situated some distance in the rear of the shield, and fitted with two air locks—one for men and the other for materials. The steel rings are mounted under the rear of the shield, and the outside cement is rammed in place, the diameter of the cylindrical shield hood being large enough to admit this cement over the rings. This outer coating of cement also seals the working chamber against the sand and water outside. The shield is pushed forward by sixteen hydraulic rams, abutting against the last steel ring put into place, in the usual manner.

This tunnel was commenced in February, 1896, and was finished in February, 1899; but, after finishing 525 feet of the tunnel, the work was interrupted for one year. It was finished without any serious accident, and a tunnel of similar design and 6560 feet long is now under construction at Hamburg.—Engineering News.

NO MORE striking statement bearing on American ascendancy in the steel trade has been made than that contained in an address by Joseph Lawrence, before the Chamber of Commerce of Newport, England, recently. It was to the effect that Mr. Schwab had told him that the United States Steel Corporation could deliver steel billets in England for \$16.50 per ton, whereas the lowest price for which English manufacturers could make them was \$19 per ton, and that when certain ocean transportation arrangements were completed the American price would be still lower, and this in spite of the fact that the corporation's steel workers get more than double the wages paid British workmen in the same line.

A Water Ditch Waste Gate.

Written for the MINING AND SCIENTIFIC PRESS.

The American River ditch, as it is known, takes 1600 inches of water out of the American river, in Placer county, California, about 4 miles south of Auburn. The elevation at the head gate is 450 feet. The ditch lies in the American River canyon for 9 miles, then leaves it to meander among the foothills to a point 2 miles northwest of Folsom, from which the water is distributed in pipes for domestic service and irrigation. The water for the greater portion of the year carries a large percentage of silt in suspension—so much in fact that it has to be settled and cleared before use. This is effected in a number of small settling reservoirs on the line and in the reservoir at the end of the ditch.

The first reservoir was made by building a low dam across a flat valley. This gave a considerable area, but ultimately it filled up with sediment, floating debris and a growth of willows. Increasing consumption of water exceeding the capacity of the pipe main from this reservoir, a new reservoir was built. The water having a fall of something about 60 feet in the mile distance between the old reservoir and the head of the valley in which it was built, a mile of new ditch was built from the head of the valley along the hillside with a fall of 6 feet. At this point, 54 feet higher than the old reservoir, a flat on the side afforded an opportunity to build a new reservoir. With an earth dam built in a half circle, three-quarters of an acre was enclosed. A maximum depth of 8 feet and a mean depth of 6 feet of water was provided. This was sufficient storage to protect the domestic supply during unavoidable interruptions to the flow. From it the pipe delivery had 54 feet more head and served for several years without additional main construction.

It was impossible to so locate the reservoir that there could be a drop into it from the ditch. The topography forced the construction so that the ditch water surface and the surface of the water in the reservoir when the latter was full was the same. The small capacity of the reservoir and the dependence on it for a continuous domestic supply made it necessary to plan so that it would be kept continuously full. Instead of planning to clean it of accumulations of silt and floating trash, by emptying it from time to time, provision had to be made to keep all such material from getting in it. The system of settling line reservoirs for the silt has already been referred to. One of these was located at the starting point of the last mile of ditch at the head of the valley described.

The silt that passed this last settler had to go to the terminal reservoir. By opening, for a few minutes daily, a waste gate drawing from the bottom of the reservoir, the accumulation of silt was kept down. The hillside above the ditch in the last mile being heavily timbered with pine and oak, considerable quantities of leaves, pine cones and branches came into the ditch and floated down toward the reservoir. To keep this stuff out, the construction illustrated was built.

It consisted of a double box built into the line of the ditch. Each side of the box could by itself carry the entire flow. In service both sides were left open, giving a double cross section for flow, and as a consequence halving the velocity of approach. Each box was provided with a separate waste outlet box and waste gate and each side of the box with gates at both ends. To retain the floating trash from entering the reservoir, screens—woven wire mesh ¾-inch opening, of No. 10 gauge—were set in each side, the bottom in each being on the reservoir end of the waste box outlet. The screens were inclined at 45° toward the inflowing stream. This forced the water flow to rise through the screen, as it were.

Floating trash accumulating and becoming water-soaked would fall off of the screen through the water into the waste outlet box.

When it was desired to clean the latter, one side at a time was taken. First the two end gates were closed down, shutting off the box from the ditch at both ends and forcing all the flow through the one open side. The waste gate of the outlet box of the closed side was then raised. The outflow of the water through the waste box swept with it the leaves, silt and debris generally that had accumulated in the bottom. The reverse flow downward through the inclined screen cleaned the latter more thoroughly than would be the case with the screen set vertical. After one box was cleaned, its waste gate would be closed and the end gates opened, permitting the ditch flow to pass through it again. The cleaning operation would then be repeated with the other side. The construction described has been found in service to work very satisfactorily. The flow into the reservoir is not interrupted by the cleaning of screens, which is unavoidable. Water does not have to be shut off from the ditch, and there

Waste Gate Construction for Ditch.

is no loss of water at all in the cleaning. The debris is carried down a small ravine into the old reservoir, where it accumulates and is burned whenever the accumulation becomes so large as to be troublesome.

Water Power Engineering in Japan.

Written for the MINING AND SCIENTIFIC PRESS.

The imitative character of the Japanese seems to persist and find expression even in the plans of their engineers. The writer a few years since, while in Japan, examined a projected water power proposition in the mountains 35 miles inland from Tokio. The scheme was to generate power there and then transmit it to Tokio as compressed air. The Japanese Government had prohibited trolley car lines, and as most of the power transmitted was intended for city car lines, the Japanese, believing the underground trolley commercially impracticable, proposed to make a compressed air transmission. The water power was to be obtained from a considerable stream

which had a fall of 500 feet in 10 miles. The Japanese engineers planned to divert this water into a ditch—or, rather, canal, for they planned a light grade, making a large cross section—about 4 miles long. At this point it was to be dropped against turbines under 160 feet head. This brought the water down to the stream bed again. Another 4 miles of ditch provided another 160 feet of available fall, which, as at the other point, they proposed to use with turbine wheels. From this point of use the water was to be conducted another 4 miles by canal, and another head of 160 feet was to be used before the water was to be finally wasted back into its natural channel. Noting that there was no engineering reason why the canal should not be built about 12 miles long from the diversion point, and used under 480 feet head, the writer asked the reason for dividing the head into three parts and making three generating stations, where one would answer. In explanation the Japanese engineer exhibited a copy of a foreign magazine giving a description of the Niagara power plant, illustrated. The turbines there operated under 160 feet head, so the Japanese planned to make close copies of that plant, for which they had the technical data. They were not advised concerning high-head power development with the Pelton type of water wheels, and requested the writer to send them the plans of a plant of those wheels working under exactly 480 feet head, so that they would only have to duplicate a construction already made.

The Work of the Engineer.*

It has long been impossible for any individual to give adequate expression to the fullness of the combination of contemporary science, art, knowledge and practice which we recognize for engineering. Engineers constitute more than a profession; they amount to a "race," and it is upon them, more than upon any other class of the civilized world, that falls the heaviest share of the "white man's burden."

There have been framed many definitions of engineering and of the engineer, but none that I can esteem adequate and at the same time sufficiently exact and exclusive. My reason for holding this opinion is based on two considerations. The first is the persistence of much popular ignorance of the nature of our work, and some lack of appreciation of our class; and the second is the stubborn refusal of the English spirit to admit the necessity of any formal qualification on the part of those who claim to be of the profession. With us—odd as such a state of things may seem to our more highly organized foreign colleagues—an engineer may hold a diploma, or he may not. He may be associated with our institution, and be entitled to append a string of capital letters to his name, or he may not possess a single title to nominal distinction. This is because engineering with us does not consist in being, but doing.

The public's unformed, vague idea of an engineer is that of a man who can do things—a great and constantly increasing number of things—all falling within a wide but fairly recognized category. His quality seems to lean more to the side of invention than to that of scholarship. For my part I am content to have it so. Not that an engineer can ever be too deeply instructed, or too well trained in all the elements of knowledge and skill required for the effective pursuit of his calling; but the really great engineer is born, not made.

So subtle is the influence of words upon thought that I could wish the name of our avocation were spelt in English, as it is in languages of more pronounced Latin derivation, with a capital "I" instead of "E"—"Ingeniering," say, in place of "Engineering." Thus the nature of our work would be better recognized among the people, who are careless of etymologies. The suggestion of the name would be removed from association with the word "engine" (a good enough one in its degree, and one that has a wider significance than is now left of it), and would be placed where it rightly belongs, with the root idea which gives us the words "ingenious," "ingenuity," etc.

We must, however, go no further in this direction for the missing definition of engineering or we shall get into the clouds, where, although I am not sure but that we might find some colleges of engineering, we should miss the substance of the thing itself. For engineering is the only high art which depends as much on its cheapness for its excellence as upon any other item in the sum of its achievement.

All other things being equal—adaptability, soundness, efficiency—the engineering work which costs the least money is the best. I do not know of any other product of man's creative powers of which the same can be so truly said. The "cash" basis is the real foundation upon which the engineer builds, and this consideration draws us at once from judging engineering as merely something cleverly done by an ingenious person. It also very often serves to distinguish between college, textbook or rule-of-thumb engineering and the real thing.

At any rate, it places in due prominence a quality which those who regard engineering studies from the

college standpoint are apt to ignore. I have heard a legend of a professor of applied mechanics who was shocked at the thought of steam engines being made to sell for money—like cakes. A good deal of wasted ingenuity would be saved if those who engage in every kind of engineering work would remember to use the money standard, as well as the foot rule and the higher mathematics.

Real engineering must be mastered as it is realized on works in progress. It has no authoritative textbook. The working engineer's library is sometimes largely composed of ephemeral manufacturers' catalogues and lists of prices current of materials. Like the perfect artist described by Longfellow, the engineer must learn to work with the means that lie readiest to his hand. He must cherish his ideals or he will sink into the routine, but he, of all men, cannot afford to indulge in hobby riding. He leaves as little as possible to chance, and, if he is wise, he will not rely upon his best mathematics any further than he can see them. If he starts with aptitude, plods on with patience, observes with insight, records with careful exactitude, and adapts with wisdom, in the fullness of time he will find himself, almost to his surprise, in possession of judgment, and that is the glory of an engineer, fitting him for his highest employ as man-of-all-work to civilization.

Material civilization owes much to this faithful servant. Others may plot, scheme, invent, discover wants and their proper supplies; the engineer, as a rule, does chiefly what he is told wants doing. By strict attention to his own business he helps to make the crooked ways straight and the rough places plain for all. The engineer must have great power for concentration. His solicitude is to make every job a little better than the last. The newest steam engine shows a fractional economy of steam; the latest steamship carries her freight with a scarcely distinguishable saving in coal consumption per ton; the selected railway metal lasts a little longer than the previous purchase; the main line is straightened here and there; and, incidentally, as it were, the remote ends of the earth are brought closer together, and plague, pestilence and famine are driven back.

The wiseacres who declare on political platforms that the effect of modern civilization is to make the rich richer and the poor poorer forget all about engineering. The engineer is the chief of the modern democratic civil service.

Dutch Guiana Gold Fields.

By the courtesy of Mr. S. I. Hallett, manager of the Silver Lake mines, Silverton, Colo., this journal is able to present extracts from a personal letter to him from a friend resident now in Dutch Guiana, in South America. The Venezuela-British Guiana dispute over the territorial right to certain gold fields has made known something regarding the little known country, to which the following notes will add materially:

Local conditions here are not such as to make this a desirable country in which to remain, so you will hear from me again back in the States between now and next May or June.

Regarding the country as a gold country, I would say it contains considerable gold, some of the ground being quite rich, but such attempts as have been made are poorly adapted to its recovery. The deposits are on the surface, still are not placers. A great number of small quartz veins run in all directions, in clay and kaolin formation. The majority of these veins are more or less decomposed, forming a conglomerate similar to cement, with well-preserved crystals of quartz grouted through it. Owing to the flatness of the country, this cannot be successfully sluiced. Long sluices are required to disintegrate the cement, and even then the heavy values remain locked up in the quartz.

The gold is very free and coarse, but requires some kind of a mill to prepare it for amalgamation. The veins are sedimentary, in fissures, and the auriferous deposits cover large areas, so that mining presents more the appearance of making hay than mining. The deposits average about 18 inches thick, covered with 6 to 10 inches of soil and also the closest groves of timber and undergrowth you ever saw.

When operations have been carried on in a small way, some money has been and is being made; but the elaborate plants, so far, have proven a failure. Some of the plants are most elaborate and absurd. One company, at an expense of nearly \$200,000, put in a Florida phosphate washing machine, only to find, when it was ready for business, that they did not have a gold machine at all. Of course, it failed. Then they turned their attention to hydraulics. A large pump, driven by 250 H. P. boilers, throws the water direct to monitors. After running through sluices, the tailings are picked up by a centrifugal pump with 10-inch pipe line and are conveyed some 800 feet and dumped. They handle about 1200 tons per shift and burn eighteen cords of wood. They are washing down a small knoll and have a breast about 100 feet high; 90% of this breast is waste and 10% ore. They run about five months in the year, seven months being dry weather.

Two other companies have put in immense plants,

such as steam shovels, etc. They have been three years getting started and hope to start next year. They have each spent nearly \$1,000,000.

There never has been but a very small amount of legitimate mining attempted, being of the pull-your-leg system. There is lots of gold here, but it is not a country where mining on a large scale can be carried on. Small plants, say, a Huntington or two or a Chilian mill or two, with light boilers and engines, cheaply set up, run in one location for a season, then removed during the dry season to a new locality, can be made to pay good money on the investment; but this is no country, so far as developed, for the heavy stamp mills or extensive steam shovels and hydraulic plants. The expense of transporting machinery in the bush is enormous and can be attempted only during certain seasons of the year. The labor is abominable—the worst I ever saw. The laborers are practically slaves and absolutely worthless.

The placer ground is conceded by the Government and a tax of 5% on all gold taken out is demanded. All gold is turned over to the Government. There is no trouble to obtain concessions, nor is there any trouble to find gold.

The ground on which I am putting up this mill runs \$18 on an average. We have one deposit open for some 200 or 400 feet, 36 inches deep, that averages seven ounces per ton. I have found some handsome nuggets in this blanket. However, the majority of our ore, so far as exposed, will run from \$10 to \$15. We have uncovered this blanket some 4000 feet one way and 2500 feet another. We are still exploring, but the heavy undergrowth makes it slow work; 33½% of this deposit is quartz—just sufficient to cut the clay while going through the mill. I hope to get twenty stamps going by Jan. 1.

The health of the country is far from good. I have just recovered from a severe attack of malarial fever and know something about it. Everyone down here has the fever. It is looked upon as one of the necessary evils. It is not dangerous, but very trying on the system. The weather, of course, is hot, but the nights are cool and pleasant, so that one can stand considerable heat during the day.

But a small proportion of the colony has been explored, and there is unquestionably a great deal of gold scattered over the country; in fact, all the creeks contain more or less gold. I do not think a mining man has ever visited the country, and no attempts at legitimate or systematic work has ever been made.

To S. I. Hallett, Silverton, Colo.
Parimaribo, Dutch Guiana, S. A., Sept. 3.

Possibilities and Limitations of Electric Pumping.*

By LEWIS A. HICKS, C. E.

At the present time electric power may be said to have invaded every field in which pumping finds application, so that the only limitation imposed upon its use is that of relative economy, measured in dollars, which any given combination of apparatus can attain as compared with some alternative device actuated by power other than electricity. Practically every condition ordinarily met in pumping work has been covered in the application of electric power to the numerous pumping machines in use in California, through ropes, belts, gears and direct couplings, and while the disclosures of the Watt meter as to the power consumption of many common types of pumps are embarrassing to their makers, the accurate knowledge now available to manufacturers and engineers of economical results attained by their designs is of the greatest value as a factor in securing better workmanship and more efficient pumps. It is the purpose of this paper to sketch briefly the more important uses of electric power in this connection in California, and to make some comparative statements as to efficiency of performance.

FEED AND CIRCULATING PUMPS.—The element of greater convenience and small unit size often result in the use of steam or air, more especially when the work is isolated, notwithstanding the well-known superior economy of almost any form of power pumps, belt driven. All the advantages ordinarily lost in this way inhere in the electrically driven power pump, however connected, and it is much more satisfactory to carry current to an isolated motor than to pipe steam to the same point. The difficulty of operating power pumps is thus eliminated and shafting dispensed with.

The matter of variation in the volume of delivery can be arranged in a number of reliable methods to be entirely automatic in action, and a little mechanical ingenuity will overcome apparent difficulties and result in the electric service being made the most satisfactory attainable, both in efficiency and reliability, and when our auxiliaries are operated in this manner, the net economy of all kinds of mechanical plants will be greatly improved.

USE OF STOCK PUMPS.—Throughout the central portions of the San Joaquin valley the plane of saturation is within 40 or 60 feet of the surface; and in

* Extracts from address by JAS. MANSERGH, Pres. Inst. C. E., before the Glasgow International Engineering Congress.

* Submitted for discussion at the fifth annual convention of the Pacific Coast Electric Transmission Association, San Jose, Cal., June 18-19, 1901.

many places where the land is in use for cattle raising, the only resource for drinking water for cattle is the use of stock wells equipped with single-acting brass cylinder pumps, the rods being attached to one end of a walking beam operated from a horse-power sweep. On one of the large ranches in Kern county there are over fifty such pumping stations, each provided with an attendant, usually a superannuated old man, a mule and a shack for both. When the wells can be located within a reasonable distance of each other, the attendant may operate several wells, but his duties are usually limited to keeping the mule in motion enough of the time to maintain the water troughs full at one station.

The fifty wells are scattered over a territory about 12 miles in length and 6 miles wide; and although the wages paid are merely nominal, the aggregate annual outlay for wages, repairs and horse feed amounts to more than \$15,000. It fell to the writer to investigate the possibility of effecting a saving in this direction, and, after considering the relative merits of electric distribution with separate motors and pumps for each point, and of separate gas engine installations, he concluded that the cheaper and most reliable service would be secured by installing electrically driven air compressors at a central point, connected to all the wells with screw pipe. The air at each point was designed to be controlled by floats in the water troughs, operating pneumatic relays, consisting of a simple piston valve, capable of such adjustment as to maintain practically a constant depth of water in the troughs. The height of lift, small amount of power required at each point, and freedom from working parts to get out of order, recommended the Poehle air lift for this service, and a full-size plant was set up in the shop for testing purposes under like conditions to the actual ones and worked very satisfactorily. The expense of operation of the entire plant, costing \$40,000, was estimated to be about one-third of the then annual expense for men and mules, and this figure covered operating expense, interest on new investment and renewals. Initial pressures were determined from the consideration of the required terminal pressure at the well farthest removed from the compressor, together with the economical pressure loss, cost of pipe and power considered. Pipe diameters, leading to wells nearer the compressor on branch lines, were cut down, to use up, as far as possible, the surplus pressure, and where this was impossible, owing to proximity to mains, reducing valves were to be used. Compressors were to be in duplicate, belted to induction motors, and provided with positive valves, actuated by Corliss gear and arranged to cut off the compression of air automatically, as the load decreased by 25% decrements. The distribution required the use of 45 miles of iron pipe, and the sharp advance of this material two years ago to more than double its previous cost prevented the proposed construction.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued October 1, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE SEPARATOR.—No. 683,412; A. J. Perry, Providence, R. I.

Leaching apparatus, consisting of tub A having outlet pipe X and inlet pipe Y, pipes K and K' having valves j and i, respectively, pipes communicating with branch pipe L, vertical pipe E having a flange m and a closed lower end, coupling M attached to pipe L and having annular flange l, hub N upon pipe E having four side openings, pipes o inserted in hub N, hub P upon pipe E having four side openings, perforated pipes Q inserted in hub P, circular pipe R having branches S into which pipes Q, respectively, enter and also having branches T, pipes U entering branches T, elbows V connecting pipes U and pipes

O, curved inclined blades or scrapers W mounted on pipes O, respectively, shaft H rotatable by power and having beveled gear, and beveled gear upon pipe E and engageable with beveled gear G.

ROCK DRILL.—No. 683,533; W. W. Waite, Colfax, Wash.

A frame having an upright, a drill shaft mounted in upright and having a ratchet, a second shaft rotatably mounted upon frame, a rock lever operably connected with second shaft, a pawl operably connected with rock lever and in operative relation to ratchet, a rotatable carrier on second shaft, hammers pivoted to carrier, a friction roller carried by each hammer above pivot, spaced plates upon frame having an intervening cam slot in which rollers are received, and means for rotating second shaft to move hammers into striking position and to move them pivotally to engage drill shaft.

CONCENTRATING BELT.—No. 683,547; W. F. Bowers, San Francisco, Cal.

A belt having a flexible body and rubber side flanges, a reinforcing strip of textile fabric cut on bias extended throughout length of belt at sides thereof and extended upward and embedded in rubber side flanges, and of a second reinforcing strip of textile fabric cut on bias embedded in rubber side flanges throughout length thereof at or near top edge of flange.

COAL OR ROCK DRILL.—No. 683,628; I. Wantling, Peoria, Ill.

A two-part boxing and a feed nut, a thread bar and mechanism for actuating bar, a grip-bar support for feed nut, comprising a bar having one edge serrated, a member slidably arranged on bar and having connection with an extension of feed nut having a serrated edge and in such manner as to permit nut to swing in its support, a device for locking member and bar through serrations in bar and extension, an anchor support detachably connected with forward end of bar, and adjustable supporting means for rear end of bar.

DEVICE FOR SECURING CAMS OR LIKE HUBS UPON THEIR SHAFTS.—No. 683,656; E. H. Moyle, San Francisco, Cal.

A shaft having an eccentric portion and a hub having a keyway concentric with its bore shaft and hub being turnable one with relation to other, and a curved key tapering in direction of its curvature and disposed in keyway of hub and adapted to lock hub

to shaft when one of these parts is turned upon other.

GOLD SAVING APPARATUS.—No. 683,613; A. Marcotte, Gaston, Cal.

In this apparatus a sluice is employed having plates suspended above the sluice, said plates with convex lower surfaces which rest upon a current flowing beneath. The plates are provided with adjustable counterbalances, and suitable means are provided for supplying material to flow through the sluice. The convex bottomed plates have surfaces which will retain the small particles of light gold or other valuable material which is often carried in suspension, or near the upper surface of the flowing mass, while suitably disposed quicksilver pockets act to save the heavier gold which is carried along the bottom.

ATTACHMENT FOR ORE SAMPLING MACHINES.—No. 683,844; A. C. Calkins, Los Angeles, Cal.

A vertical standard, a frame supporting a rotating bucket, a horizontal driving shaft with a cam, a rocking hopper, a shaker rod attached thereto and bent at right angles at lower end with a coil at angle, and then being extended beneath cam and pivoted to a stationary support, a lever fulcrumed on this support, and a restraining rod extending from lever to hopper for separating shaker rod from cam.

MINING MACHINE.—No. 683,864; H. C. Sergeant, Westfield, N. J.

A drilling cylinder provided with trunnions and wheels for supporting it, a brake shaft and rollers thereon adapted to run on same surface with wheels in rear thereof, a brake on shaft, bars pivotally connecting shaft with cylinder trunnions, a hand lever on shaft, a spring connecting lever with one of trunnions for pressing brake to wheels, a connection between lever and cylinder for limiting movement of hand lever by which brake is withdrawn from wheels.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Alaska-Treadwell mine reports for the month ending Sept. 15th 76,763 tons ore crushed, valued at \$71,139, and 1160 tons sulphurets saved, valued at \$43,760. Total product, \$123,738, the ore averaging \$1.61 per ton. Gross expenses were \$65,500. Expense per ton, \$0.8275.

KETCHIKAN.

E. P. Spalding of Kansas City, Mo., has commenced the work of development of the Hicks, Caughrean and Reynolds mines at Helm Bay, which are under bond to the company he represents.

At the Puyallup mine, on Prince of Wales Island, the 2-mile tramway has been completed to Hollis, and twenty-five tons of ore have been brought out and shipped. A chimney of very rich ore has been found. It is claimed that the pay-streak shows assay values of several hundred dollars a ton.

The diamond drill operations at Tolstoi, on property under bond to P. Clark of Spokane, Wash., in the first boring struck the ore body at a depth of about 70 feet.

S. I. Silverman of Copper Mountain says returns from a shipment of 175 tons of ore to the smelter show 31% in copper. At the New York claim the winze from the bottom of the second tunnel level shows 9 feet of ore that runs 30% copper.

VALDEZ.

The Valdez district is rich in copper and has coal, timber and other natural resources. Such is the opinion of J. Day of Spokane, Wash., who has made a prospecting trip in that district. He says that from Valdez extending east for 150 miles is a mineral belt 20 or 30 miles wide rich in copper. The Big Bonanza mine, located 150 miles east of Valdez, has an immense quantity of ore in sight, exposed by a slide, that will run very high in copper. During this summer engineers have made a preliminary survey for a rail line to it. Some development work is being done on this property, and on another mine in the same section a shaft has been sunk 150 feet, a crosscut run and a large body of high-grade copper found. There are also large deposits of good coal in the country, and the blacksmiths at the mines there are now using this local product. There is a copper mine on Virgin bay which has been sunk to a depth of 250 feet and is shipping ore.

ARIZONA.

COCHISE COUNTY.

J. M. Hawkins of the Cochise M. & M. Co. has returned to Denver, Colo., from the mine, which he has been inspecting with a view of building a 100-ton smelter. Mr. Hawkins states that \$20,000 to construct the smelter has been raised, and that the company is carrying on a number of experiments to determine the best process to use.

The new combination shaft at the Tombstone mine is down 450 feet and is being continued by three eight-hour shifts toward the 600-foot level, where water will be struck and the ore body penetrated. When the water shall have been reached a system of pumps will be installed and systematic exploration begun. An 800 H. P. boiler, weighing 45,000 pounds, has been ordered and the pumps have been specially constructed to have a capacity of 1700 gallons per minute.

GILA COUNTY.

The Arizona-Colorado Copper Belt & G. M. & M. Co. has been incorporated by Denver, Colo., people, to mine near Globe, Arizona. There are several shallow holes on the claims which show good ore, and a vein of copper ore 2 feet wide, samples of which average 15% copper, besides other values. The company will commence work in a very short time and propose to sink a shaft on the vein to the depth of 200 or 300 feet. J. F. Hechtman will be resident agent at Globe.

GRAHAM COUNTY.

Fleming Bros. of Tucson make a report of a gold discovery 70 miles north-east of Tucson, in the Galluro mountains, in a vein, according to their statement, 200 feet wide and exposed in outcrop for 6000 feet. A canyon cuts through the vein 200 feet deep, exposing ore on both sides the entire depth of the cut. They assert that from the bottom of the canyon to the surface the outcroppings of ore will run from \$5 to \$100 to the ton.

MARICOPA COUNTY.

A ledge of silver-bearing ore 20 feet wide has been discovered at Wickenburg on the Sahuaro property, owned by Nickless, Miller & Brennan. The new find was uncovered by chance and 3 feet below the

surface many large chunks of native silver were picked up. The best specimen was a chunk of ore about 10 inches square, so heavy and rich in silver that no man in the camp could lift it.

YAVAPAI COUNTY.

J. Berry has leased his Lincoln mine, Walker district, near Prescott, to Abernathy & Buell. The ore is claimed to run from fifty to eighty ounces of silver and up to \$10 gold.

H. McCrum and W. C. Parsons have sold to D. M. Hood for \$150,000 the Gladstone and Sink to Rise mines near Prescott.

CALIFORNIA.

ALAMEDA COUNTY.

The success which the mining of iron pyrites on the Beamer ranch, near Leona Heights, Oakland, has made, has started the Realty Syndicate, which owns thousands of acres near by, prospecting for pyrite deposits. A lead has been struck which it is thought will pay. Fifteen men are at present working night and day on the tunnel. The Stauffer Chemical Co., which is working the deposit on the Beamer property, is shipping two or three cars of ore daily by the electric road to its works near Pinole. The supply is practically unlimited and is considered valuable, as the price of sulphur has increased. The deposit is the closest on the coast to the chemical works. Supt. Storch, in charge of the work at Beamer's ranch, states that his company had also been offered a contract to supply fifty tons a day for three years.

At the Amador-Phoenix mine, J. E. Dye superintendent, the new hoist has been completed and sinking resumed. Three shifts of two men to the shift and two engineers will be employed. It is expected to have the mill ready for operating in two or three weeks.

The Amador County Miners' Association, at a meeting held on the 9th at Sutter Creek, elected twenty-seven delegates to the California State Miners' Convention and re-elected J. F. Parks president of the association; W. A. Pritchard was elected vice-president; J. E. Dye, secretary, and M. Brinn, treasurer.

CALAVERAS COUNTY.

Work has been commenced on the Last Chance mine, at Hodson, and a shaft will be put down. D. Cabrera of Hodson is Supt.

The Utica mine, at Angels, expects to close down about Oct. 15th, to repair the ditch and flume, and also to do three weeks' necessary work on the mines there.

The Lone Star mine, near San Andreas, operated by the Farrington G. M. Co., has been shut down by Manager Pugh.

Supt. O'Neill of the Del Monte mine, near West Point, reports the tunnel in 280 feet from the shaft.

The Melones M. Co.'s dam at Robinson's Ferry has been completed under the supervision of W. C. Ralston, and six hours after closing the floodgates the water was running over the crest. Work upon the flume begins at once to convey the water to the 120-stamp mill at Robinson's. The management expect to be crushing ore Jan. 1.

EL DORADO COUNTY.

Supt. W. E. Thorne, of the Gold Bug mine at Georgetown, is preparing to install a hydraulic elevator on the property.

Operations on the Zantgraf mine, Auburn P. O., have been resumed, after having been closed down since the first of June. The Montauk M. Co. has sold the mine to Eastern people. Timbering and cleaning out the mine is being done preparatory to sinking. A. B. Eastwood, formerly of the Hathaway mine at Ophir, is acting Supt. D. H. Coles, representing the Eastern owners, is at the mine.

KERN COUNTY.

The combination of Kern oil companies, it is said, is about to be completed. The question of entering the combine with a capital of \$40,000,000 is being submitted to the stockholders of the several companies. The combine will control from 65% upward of the output of the Kern field, while of the remainder a considerable proportion is said to be contracted for a series of years, leaving but a small percentage outside free to compete. The combine will be able to control the price of oil up to a certain point. Its policy is declared to be to place the price in the Kern River field at least as high as 50 cents.

NEVADA COUNTY.

The Gold Flat Eureka at Grass Valley, closed for over twenty years, has been reopened. Supt. B. W. Hosking is sinking a new two-compartment shaft toward the 600-foot level.

Supt. Mallen states that in sinking the shaft at the Brunswick mine from the 1000-foot level over 100 feet has been accomplished. The shaft will be pushed down to a depth of 1250 feet before any drifting is done.

In the Seven-Thirty mine at Grass Val-

ley a strike has been made of a rich shoot of ore which shows much coarse gold. It was made in the 200-foot level, the ledge being about 6 inches in width. A heavy copper streak follows the foot wall which is of considerable value. The owners are M. D. Morrison, J. Frandy, D. Voss, J. Norton and C. J. Bryant of Nevada City and J. Riley of Grass Valley. They have the mine on a bond.

C. M. Root has started up the New Independent mine, on Wolf creek, above Moore's Flat. Some new machinery is to be installed.

Operations at the Stiles mine in Nevada City have been suspended temporarily. J. C. Rich, from whom the mine was bonded, has taken possession of the property on account of the failure of the bondees to make the payment which was due on the first of the month.

PLACER COUNTY.

Developments at the Central quartz mine, near Towle, continue to show a fine ore body. New machinery is being put in the mill.—The Pioneer-Linn G. M. Co. are having their dam repaired, ready to commence operations at the Pioneer quartz mine. G. H. Stone is Supt.—A new tunnel is being run on the ledge at the Southern Cross quartz mine. They have encountered some very rich ore.

SAN DIEGO COUNTY.

London people have bonded the American Girl mine, 6 miles from Ogilby. It consists of six claims on well-defined veins of gold-bearing, free-milling ore, of which an enormous quantity is claimed already blocked out. The mine is owned by H. H. Markham, G. C. Coffin and F. S. Daggett of Pasadena and D. W. Field and T. Johnson of Los Angeles. The price in the bond is said to be \$2,000,000.

SHASTA COUNTY.

A. Bell and A. G. Boggs of Redding, owning the Golden Star, Golden West, Bell, Flambeau, Caballero, Alcalde, Boom Ledge and Stone Arabia claims, on Mule mountain, have consolidated under the name of the Golden Star group.

G. J. Heath, of Buckeye, is owner of a rich quartz ledge in the town of Buckeye, from which he is shipping a heavy sulphureted ore to Keswick to be smelted. Some of the ore is so rich in free gold that the gold is obtained by pounding it out in a mortar.

At the Corinne mine on Salt creek, Watson & Watson, who have a lease from E. P. Connors, are taking out ore that, sold at the smelter, nets them \$20 per day. The Corinne is one of the Connors group and has been operated by Connors & Son for several years.

SIERRA COUNTY.

Mining will be resumed this fall in the Wild Boar mine at Gibsonville. A power drill will be put in.

SISKIYOU COUNTY.

Development work on the Pumpkin Roller quartz mine, in the Soda Creek district, near Dunsuir, has produced ore which assays \$6.60 gold and some copper and silver. Over 600 feet of tunnel has been run. J. E. Childers and L. C. Drake last week finished a contract for 150 feet, and will commence another contract soon for 50 feet more.

Trowbridge, Burns & Mann of San Francisco have bought the Carter, or Black Hawk, quartz mine, at Oro Fino, which they intend opening up, and have leased the Johnson quartz mill for crushing the ore taken out.

SOLANO COUNTY.

A. A. Dickie has sold to J. Rosenfeld's Sons of San Francisco 140 acres of land located about 5 miles northeast of Suisun. It contains deposits of lime rock, the extent of which has been determined by sinking shafts and drilling test holes under the supervision of R. H. Doolin. A deposit of blue clay underlies the lime rock. The Eureka Portland Cement Co. has been incorporated by J. Rosenfeld's Sons, Pope & Talbot, Goodall, Perkins & Co., and J. D. Spreckels & Bros. Co., capital \$1,000,000, and will erect cement works with a capacity of 1000 barrels of cement daily; they will employ about 300 men. The price paid for the Dickie property was \$20,000. In addition to the land, rights of way have been secured over adjoining tracts a distance of 2 miles to the Southern Pacific Co. tracks for a private railway.

TRINITY COUNTY.

D. Pesenti is making a prospecting trip to the Hay Fork district with the intention of seeking deposits of platinum, which he believes exist there.

TUOLUMNE COUNTY.

At the Republican mine, at Jacksonville, the shaft is being changed to provide for a skipway in both compartments. The ditch is being cleaned and the mill overhauled.

At the Clio mine, at Jacksonville, a working tunnel is being driven to strike the ledge about 225 feet below the hoist-

ing works. A. Keith, foreman, is in charge of the mine.

Supt. A. C. Morrison of the Crystalline mine, near Jamestown, has the new ore bin receiving rock and the tramway to the mill is completed. Other mine structures and the 10-stamp mill have been put in readiness to begin milling. Hoisting and compressor engines are run by steam, oil being used for fuel; the mill by electric power.

The hoist construction on the Golden West mine, at Sonora, is completed and sinking from the tunnel level commenced. The tunnel, now in 1125 feet, is being extended.

The Rhode Island mine plant, near Sonora, is being prepared for the resumption of work. The boilers have been reset and a new pump will be placed at the bottom of the 450 shaft. At the 400 level a pump of 200-gallon capacity is already installed.

A large amount of gold—reported many thousand dollars—was taken out of the Bonanza, the pocket mine situated in Sonora, about the first of the month.

W. D. Bannister is arranging for putting in working order the Columbia marble quarry. The rough rock material will be shipped to San Francisco and there sawed and polished, for which purpose a mill will be erected.

COLORADO.

BOULDER COUNTY.

The Delano mill at Boulder, for the treatment of gold and silver ores, with offices, ore houses and other buildings, occupying about five acres of ground, was destroyed by fire on the 8th inst., with a loss of \$100,000, partially insured. The mill was owned by Rhode Island capitalists.

CHAFFEE COUNTY.

The sinking of the new shaft in the Bassick mine, near Silver Cliff, a farther distance of 900 feet has been let by contract to be completed in six months—an average of 150 feet a month. To accomplish this, drifts will be run from the old shaft at different levels, under the new, and several crews of men will be engaged in sinking and upraising until the work is completed. It will require nice surveying to make the several workings connect up so as to make the perfectly perpendicular shaft.

The Eclipse mine at Monarch has a reduction works proposed for construction to treat the low-grade ores. J. C. Mitchell is president and B. Disman secretary of the company.

DOLORES COUNTY.

D. Campbell, S. Snyder and J. Lumsden, in the interest of the Remington M. & Power Co., have been examining a \$50,000 plant for mining on the Dolores river. J. J. Lumsden of Grand Junction has the contract for placing the machinery. Two water wheels of 250 H. P. each will be used to lift the water up 800 feet. The placer grounds on the Dolores have been worked in a crude way for years, but, with improved machinery, the Remington Co. expect to work on a large scale.

GILPIN COUNTY.

Shipments of smelting ore, tailings and concentrates from this county for September are 5716.5 tons. The various mills at Black Hawk and elsewhere in the county have all run full time during the month. The shipments from Black Hawk for September this year, as compared with September last year, show a gain of 92.5 tons. It is estimated that the average value of the ore sent to the smelters will run \$50 to the ton, making an estimated gross value of \$285,800. The banks have shipped mill gold to the value of \$245,000.

GUNNISON COUNTY.

The Augusta mine, 12 miles north of Crested Butte, which has been closed down on account of the low price of silver, is now being reopened by the Woods Investment Co. of Cripple Creek, who have bought it. A tunnel has been started to enter the vein 1200 feet below the present workings, and machinery, including an air compressor, is being installed. The McKenzie group, near Pitkin district, has been sold to Denver and Eastern people for \$25,000. The group is composed of the McKenzies Nos. 1, 2 and 3, and has been under bond to A. Hartman and A. Lejane for the past year.

The Vulcan M. Co. is unwatering the Vulcan mine, at Gunnison, preparatory to resuming operations. The shaft on it is over 400 feet deep.

HINSDALE COUNTY.

J. Fitzgerald of Leadville has purchased the Independent mine, on Henson creek, Lake City, for \$50,000—\$5000 down. The seller is R. E. Peniston, who bought a three-quarter interest for \$1000 a few months ago.

LAKE COUNTY.

There are at Leadville several new manganese producers lately shipping, and the

manganese output, which was on the decline, will amount to over 6000 tons a month, the most of the ore going to the Illinois Steel Works. The Caribou mine is one of the new manganese producers. The Sixth street shaft, the Fairview, the All Right and the Colorado are all shipping some manganese at present.

The output from the mines in the Leadville district for September was between 60,000 and 62,000 tons, at a value in the neighborhood of \$1,000,000. The tonnage is somewhat less than that of previous months, owing to the fact that the smelters were unable to handle the sulphide ores.

MINERAL COUNTY.

The American Sulphur & M. Co. has started up its new retort and commenced operations. The refining plant at Creede is quite extensive.

SAN JUAN COUNTY.

The impounding of the tailings from the Silver Lake mill in Silver lake, at Silverton, has been going on for many years, and is slowly but surely crowding the water out of its 200-foot deep basin. This was done with a view to ultimate treatment of the tailings when a new mill should be erected. Now that the great mine has new owners and S. I. Hallett, the manager, is remodeling the terminal mill, it is understood that he will arrange for the treatment of these tailings.

TELLER COUNTY.

During September the output of Cripple Creek mines, as compiled from the returns of the different mills and smelters, was as follows:

| | Tons. | Per Ton. | Value. |
|------------------------------------|--------|----------|-------------|
| Colo.-Phil'a and Standard..... | 24,000 | \$28 | \$ 672,000 |
| Dorcas..... | 2,300 | 25 | 57,500 |
| Economic..... | 4,100 | 33 | 135,300 |
| Miscellaneous including Atlas..... | | | 29,700 |
| Smelters..... | 21,500 | 65 | 1,397,500 |
| Totals..... | 53,300 | | \$2,292,000 |

The companies that paid dividends and the amounts are:

| | |
|-------------------------|-----------|
| Elkton..... | \$ 75,000 |
| Free Coinage..... | 120,000 |
| Gold Coin..... | 30,000 |
| Strong..... | 25,000 |
| New Zealand..... | 7,650 |
| Consolidated Mines..... | 19,000 |

Total.....\$276,650

The lower levels of the Isabella mine at Cripple Creek have been abandoned and the pumps drawn. The official statement gives as the reason inability to find ore in the fourteenth level of paying commercial value in quantities to warrant a continuance of the expensive development work.

The Atlantis Mines Co. has taken up its bond on the Santa Rita claim at \$100,000. The bond had run eleven months and had seven months more. The money, which was paid to the Santa Rita G. M. Co., was obtained from the property, with \$50,000 besides and the money expended for labor.

No lateral work is to be started on the Bostwick claim at Cripple Creek until a depth of 500 or 600 feet has been attained. The shaft is now down 230 feet. At 500 feet a crosscut will be started southeast to meet the Thompson vein of the Elkton Co.

A rich strike is reported in the 700-foot level of the Elkton at Cripple Creek. It is said that in the 5-foot vein a 3-inch streak of sylvanite has been opened that gives average values of \$5000 a ton, and on each side of the streak are 2½ feet of rich rock that will run several hundred dollars a ton.

F. F. Castello, F. L. Ballard, G. L. Keener and M. S. Herring of Cripple Creek have incorporated the Sunset-Eclipse G. M. Co. in Wyoming, to take over the Sunset and Eclipse mines at Cripple Creek.

At a meeting of the directors of the Free Coinage M. Co., held at Denver, W. C. Neville of Altman was elected president in place of the late S. Strong, and A. H. Martin of Denver was elected secretary. The company owns a large group of claims on Bull hill, Cripple Creek, and the main workings are now producing about 300 tons a month. There is a large area of the company's ground which has not yet been explored. The company is a close corporation.

IDAHO.

ADA COUNTY.

The El Paso mine, at Pearl, operated under the management of G. Mitten, is shipping ore to Boise to be tested. The ledge is said to be 14 feet wide. It is opened by a tunnel which is in 350 feet.

A. Charlebois of Montreal, Can., and I. B. Perrine of Blue Lakes, have completed arrangements with R. W. Paris of Boise for the complete hydraulic mining equipment of placer mines on Snake river

owned by a company in which they are interested. The water from Blue lakes will be piped across Snake river.

BINGHAM COUNTY.

The Cariboo G. M. Co. has been incorporated at Mercur, Utah, capital \$500,000, to operate the Roosevelt Nos. 1, 2, 3 and 4. A. L. Castleman is president and T. B. Wilde secretary, with office at Mercur.

The Blackfoot M. Co. has been incorporated at Mercur, Utah, capital \$500,000, to operate the Golden Gate Nos. 1, 2 and 3 claims, in Mt. Pisgah district. G. Z. Edwards is president and G. W. Luft secretary and treasurer, with office at Mercur.

G. W. Bredehoft, manager and principal owner of the Daisy mine, at Neal, reports that the shaft is now down 210 feet. The vein has been explored and the shaft will be put down 75 or 100 feet farther.

F. Hunt, Supt. of the Pittsburgh M. Co.'s properties at Cariboo, reports the development at a point 400 feet from the mouth of the lower or main tunnel of nearly 3 feet of ore, which shows a large amount of free gold in spots and mills an average of \$50 per ton. The new mill is being equipped rapidly. The Pittsburgh is controlled by A. L. Castleman, T. B. Wilde and M. Mahnen of Utah and Eastern investors.

BLAINE COUNTY.

A. Wilson of Martin says that at Lava Creek three groups of claims are being opened and several individual owners are operating. W. Darlington, who has a year's bond on Wilson's group, has discovered a new vein which he has crosscut 44 feet without finding the footwall. Assays run up to \$7.44 in gold and 36 ounces in silver.

A strike is reported from the Black Cinder group of mines on the Hailey gold belt. The vein is claimed to be 18 inches thick, of solid galena ore that assays between 600 and 700 ounces in silver per ton.

CUSTER COUNTY.

The White Knob Copper Co., at Mackay, are working over 200 men. Work is being pushed on the 600-ton smelter. The company are also putting in an electric line to the mines to haul the ore to the smelter.

IDAHO COUNTY.

M. A. Ellis, owner of a one-fourth interest in the Wild Rose mine, near Pierce City, reports that the latest cleanup for a five days' run of the prospecting mill is twelve pounds of gold bullion, worth \$1732, taken from twelve tons of ore. At the bottom of the 70-foot shaft he says there is 12 feet of ore, with three rich streaks, averaging 18 inches each. The Wild Rose Co. expect to put in a large mill next spring.

H. Willison, of the Ohio-Idaho M. & Dev. Co., which has bought the Orion mine, at Pierce, says the company has commenced development work. A large hoisting plant has been installed and the main shaft is now down 300 feet or more.

KOOTENAI COUNTY.

The Sunday Morning shaft, at Tyson, is now down about 100 feet, of which 25 feet was driven through solid iron capping. At a depth of 37 feet a 3-inch stringer containing free gold was crosscut. C. Tapings is Supt.

J. W. McNeil has bought a half interest in the Pearce placer claim, at Tyson, and with Mathews & Schrader, the owners of the other half interest, will work the property this fall.

W. H. Rambo and associates, who are owners of the Jumbo and Little Hero placer claims at Tyson, will work twenty-five men when the season opens.

J. Dugan has men at work clearing his claim, preparatory to operations on a large scale when the rains come.

MONTANA.

BEAVERHEAD COUNTY.

The Polaris mine, at Polaris, under bond from J. E. Morse of Dillon to J. E. Rickards and J. Maginnis of Butte, has been closed temporarily, it is said, while Supt. Van Zant is absent to procure additional machinery.

NEVADA.

LINCOLN COUNTY.

The Quartette M. Co. is developing on the new 500-foot level at the mine at Searchlight and has opened a large ore body. The mill at the river has been closed down pending the addition of fifteen stamps and the building of the 12-mile railroad from the mine to the mill. Grading is completed and steel rails are being laid. The Searchlight mine has been idle for months, but is now being started up again.

The Piute Valley G. M. & D. Co. has been incorporated under Delaware laws to mine at Searchlight, where the company owns the Domestic, Quaker Girl, Tripod, Bonanza and Shawnee claims, on which considerable development work has been done. Three of these claims show a

good grade of free gold ore. F. L. McKee of Plymouth, Penn., is at the head of the company. D. E. Miess is superintendent of the company's mines at Searchlight.

The Wilson M. Co. is sinking on the Louis Mountain mine. E. J. Coleman is Supt.

The El Vira claim, recently bonded by Los Angeles people from T. D. Forney, is to be opened up at once by sinking a shaft.

LYON COUNTY.

The California company that has taken a \$2000 bond on the Lizzard mine, below Dayton, is preparing to install a milling plant on the Carson river below what is known as the Coone ranch.

WASHOE COUNTY.

A mill test is being made of ore from the Forlorn Hope mine at Olinghouse. The ledge in the Forlorn Hope is 7 feet wide. Returns from a small shipment to Salt Lake gave \$70 per ton.

The mill at the Hully-Logan mine in Como is operating five stamps, as the cyanide plant cannot handle the full crushing capacity of the mill.

The Gold-Copper Ex. Co., an Eastern company, of which C. Norcross is president, has made a strike in the Norton-Bidwell claim at Pyramid, where the ledge was opened by an 80-foot shaft and a 70-foot drift. Where cut the ledge is 15 feet wide. Several feet, it is claimed, will run \$20 a ton, and a smaller seam, several inches wide, assays \$115.48. The ore is free milling.

At the North Star mine, owned by Nelson & Williams of Reno, a crosscut has been run from the shaft and the ledge found again.

Cutts, Norcross & Pothoff are developing their Copper Queen mine, 3 miles northwest of Reno. The ledge at the bottom of a 50-foot shaft is 12 feet wide and carries a pay streak 4½ feet wide, nearly all of which is shipping ore.

WHITE PINE COUNTY.

J. A. Snedaker, E. L. Giroux and D. E. Shear have sold the Ely mine to St. Paul, Minn., Burlington, Iowa, and Eau Claire, Wis., people. J. Giroux, manager of the United Verde copper mine, is to manage this property. The mine comprises fifty claims carrying copper and gold, the copper ranging as high as 30%. Plans are being prepared for a 400-ton smelter. A railroad to Eureka is projected.

NEW MEXICO.

DONA ANA COUNTY.

Copper has been found in the Potrillo mountains, also gold, silver, lead and a fine quality of marble. It is claimed that placer gold exists in them. E. A. Chaffee and Lewis Goodman of Las Cruces have a marble claim and are preparing to open a quarry. F. L. Oliver, of Las Cruces, has several copper claims and is doing considerable development work.

GRANT COUNTY.

A. E. Dawson has commenced shipments from the Anson S. at Fierro. A steam hoist is to be erected.

Crumbine, Knolton & Cornell are tunneling on their mine at Pinos Altos and claim to be taking out ore, largely native copper.

Dimmick Brothers are taking out high grade silver ore from the Silver Cell mine at Pinos Altos. Much of this ore runs several thousand ounces to the ton. The Dimmick smelter is expected to be started up soon.

The Clifton Copper Co. at Santa Rita has its 100-ton concentrator completed. The company has commenced sinking a large double-compartment shaft, to be the permanent working shaft.

SAN MIGUEL COUNTY.

A number of good claims are being worked in the Rociada mining district, which is about a year old. Kelley & Jumbach are working the Azure mine and are down 50 feet on a 7-foot vein of copper glance ore. The Rociada G. & Copper Co., with J. L. Matt as manager, is down about 175 feet and is taking out ore. Bolock & Kelley have a vein about 90 feet in width, which gives good values in gold, silver, lead and copper. The shaft is down 85 feet.

SIERRA COUNTY.

The New Era mine, near Chloride, is being developed under L. Terry, manager. Mine buildings have been completed and a raise to connect the lower tunnel with the upper workings is under construction. Shipping ore is being sacked from the raise.

J. F. Lucius, who recently bought a lead mine near Rincon, has sunk a 70-foot shaft on it and uncovered a 3-foot vein of copper, ore from which averages 26% copper.

SOCORRO COUNTY.

The Little Charlie, Combination and Little Giant, at Cooney, are on the extension of the Little Fannie vein. At two

points of development in the Little Charlie a strong vein is opened and at one point the work is believed to have already tapped the rich ore shoot which has given value to the adjoining mine.

The Helen M. Co. has resumed operations at the Confidence mine, at Graham, where it has been installing new machinery. The deepest working in the mine is now down 987 feet. It is intended to sink to 1200 feet with the present hoist, when it will become necessary to put in another.

VALENCIA COUNTY.

The Zuni Mountain C. Co. has located twelve claims near Copperton, 18 miles west of Grants. Several hundred feet of development work has been done. A copper smelting plant is to be erected. W. J. Black of Santa Fe is president of the company.

OREGON.

BAKER COUNTY.

P. A. Campbell of the Flagstaff mine, at Baker City, proposes to reopen and develop the mine, starting the work now.

JACKSON COUNTY.

Davidson Bros. of Jacksonville have sold a quartz claim, situated near the head of Ward's creek, to O'Neill, Meade, Landreth and Shoup of Baker City for \$3000. This property was discovered and sold by the Davidsons inside of a month.

D. J. S. Pearce & Son of Jacksonville have bonded the Access mine, in Poorman's Creek district, to R. Bond for \$10,000. This ledge is several feet wide, with ore which assays from \$3.75 to \$9 in gold per ton.

G. Hoffman and F. J. Bolt of Jacksonville have had several tons of ore from their ledge on Tallow Box mountain worked in an arrastra, obtaining \$50 a ton.

MARION COUNTY.

Colorado Springs, Colo., miners have been prospecting a mine of gold-bearing quartz, 10 miles north of Detroit, and it is reported that they are getting very satisfactory results.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The York claims, at the head of Friday gulch, near Hills City, have been sold to a company consisting of Chicago and Deadwood people. The ore is high grade and free milling. There is a small shaft on the property, but the new company will sink it deeper.

UTAH.

BEAVER COUNTY.

The Bluebird Copper-Gold M. Co., Ltd., incorporated in the State of West Virginia to do mining, smelting and numerous other lines of business, with offices in Syracuse, N. Y., propose to do copper mining in this county. P. A. H. Franklin of Salt Lake City, M. J. True of Buffalo, N. Y., C. S. Hutchinson of Syracuse, N. Y., and J. Kittinger and F. A. Fox of Buffalo, N. Y., are the incorporators. C. C. Dey of Salt Lake City is appointed local agent and attorney.

The Estella G. M. Co. has been incorporated to develop the Havana Nos. 2, 3 and 4, the Gold King Extension, the Dewey, and bonds on the Gold King, Defender and Havana claims in the North Star district. The incorporators are: S. S. Curry, of Ironwood, Mich.; E. A. Wadhams, of Milwaukee, Wis.; and W. H. Penrose, C. C. Dey and W. H. Bramel of Salt Lake City. Capital is \$500,000 and office Salt Lake City.

BOX ELDER COUNTY.

The Blackbird Copper-Gold M. Co. has been incorporated in West Virginia to work Utah mines, by C. J. North of Buffalo, N. Y., P. A. H. Franklin of Boston, Mass., M. P. Gilbert of Chicago, Ill., W. G. Wells and A. G. Sherman of Buffalo, N. Y., with office in Salt Lake City.

The Little Jimmie M. & M. Co. has been incorporated, capital \$125,000. E. McCarrick is president and A. H. Page secretary and treasurer. The company owns the Horn Silver Nos. 1 to 7, the Horn Silver Spring and the McStein claims in Park valley.

DAVIS COUNTY.

The Kilmarack M. Co. has been incorporated to develop eighteen claims in Farmington district, capital \$500,000. J. F. Baker is president and E. D. Woodruff secretary and treasurer, with office at Salt Lake City.

PIUTE COUNTY.

At the Trapper's Pride mine at Kimberly, owned by the Madsen M. & M. Co., a body of ore has been struck which, reports state, is 6 feet wide and averages \$18 in gold. A. D. McLean is Supt.

PARK COUNTY.

The Horn S. M. Co., at its annual meeting at its office in Salt Lake City, re-elected the present board of directors, with A. C. Washington president, A. J.

Harrison secretary and treasurer and P. T. Farnsworth general manager. Concessions from the railroad and a reduction of \$2 per ton in the tariff on ores between the mine at Frisco and the valley smelter has enabled the mining of ores that were previously rejected, and the result has been a material increase in the tonnage.

SALT LAKE COUNTY.

The Clements M. Co. has been incorporated, capital \$15,000, and office Salt Lake City. W. W. Chisholm is president, J. H. Woodman secretary and treasurer. The company owns the Monitor No. 2, Clements No. 2, Handsome and Extension of Clements No. 2, in Big Cottonwood.

The Alta Con. M. Co. has been incorporated, capital \$30,000, with J. J. Burnswood president and H. Barnett secretary and treasurer. The company owns the Burnswood, Free Coinage, Climax and Bonanza claims in Little Cottonwood.

The final payment of \$25,000 for the Tiewaukee of Bingham has been made by M. S. Effinger and associates of Salt Lake City. Manager Effinger reports 12 feet of high-grade shipping ore opened.

Development work was started by the Sampson M. Co. on the Sampson and Yosemite groups—in all eighteen to twenty claims—at Bingham. Immediate operations are to include sinking 100 feet on main incline of the Sampson, now down 700 feet, and cleaning out and retimbering Yosemite No. 2 tunnel, now in 1100 feet, which is then to be continued 200 feet to connect with Yosemite No. 1 workings. The Sampson M. Co. is understood to be controlled by the Western Ex. Co., in which E. L. Kimberly, W. F. Snyder and W. G. Filer of Salt Lake City are prominent. S. M. Levy is manager, and J. Berryman foreman.

SEVIER COUNTY.

The Blue Eagle M. Co. has been incorporated with T. G. Wimmer as president and E. Williams secretary and treasurer. The capital is \$20,000, and the company owns the Blue Eagle, Blue Eagle No. 1 and Blue Eagle No. 2, in Gifford Springs canyon.

WASHINGTON.

FERRY COUNTY.

At the California mine, at Republic, the main shaft is down over 700 feet. It is claimed high-grade ore is being taken out and that there is not less than \$30,000 worth of ore on the dump and ready for shipment. Supt. Belbridge states that it is possible a diamond drill may be put in place in thirty or forty days.

OKANOGAN COUNTY.

C. M. Fassett, president of the Ivanhoe Express M. Co., has signed a bond of the Ivanhoe claims, in Palmer mountain, at Loomis, at \$100,000, to J. Boyd in the name of the Washington Dev. Co. The mines will be worked from a continuation of the Palmer Mountain tunnel, which is expected to cut the Ivanhoe ledge about where the 2000-foot level would come.

FOREIGN.

BRITISH COLUMBIA.

The Prospectors' Exchange of Nelson says: A contract has been let for the shipment of 60,000 tons of ore from the Snowshoe mine to the Greenwood smelter. The ore will be taken from the surface, where there is a very large body said to run from \$10 to \$30 to the ton in gold and copper. Work on the addition which is being made on the Granby Smelter is being rushed. All the machinery for the enlarged plant is on the ground and is being placed in position. It is thought that the entire plant will be in operation in sixty days. The Bonanza group of claims on St. Thomas mountain, Nelson district, has been bonded to E. W. Thomas of Philadelphia. A two-thirds interest in the Beatrice has been bonded by F. Fulner, the owner of the other one-third. Work will be resumed at once. C. M. McCrassan has bonded the Black Warrior group, near the head of McDonald creek, Lardeau, from T. Horn for \$50,000.

T. Curry & Co. have bonded the Iron Horse mine, Osoyoos district, from J. B. Tierney & Co. of Nelson, at \$58,000. On this property there is a 30-foot ledge which has been traced by open cuts. M. Gilliam has bonded a group of three claims in the Goat River mining division, Nelson district, for \$40,000. It is intended to work the property in a small way all winter. The interests of Silverthorn & Rogers in the Mont Miria group, Similkameen, have been bonded by A. Gallinger of Oshkosh, Wis., on a basis of \$100,000 for the property. The iron mines on Bull river, East Kootenay, have been bonded to S. W. Gebro, representing H. L. Frank of Butte, Mont., at \$120,000, for eleven months. Ten men are engaged in development work. The Northwestern Dev. Syndicate has been organized by A. F. Rosenberger for the purpose of taking over and developing mines. They

have bonded the Camborne and Oyster groups in the Fish River camp, Lardeau district. The capital is \$1,000,000. The registered office is at Nelson.

Nelson, Sept. 24.

For the week ending September 28 the Le Roi mine at Rossland shipped 1680 tons, of which 480 was second-class ore for the Trail smelter and 1200 tons high-grade ore for the Northport smelter. The Josie mine shipped 800 tons to Northport. The aggregate output was 2480 tons, as compared with 1740 tons the previous week.

It is reported that the Granby M. Co. will continue the enlargement of its smelter plant at Grand Forks to bring the capacity up to 2000 tons daily. Two additional furnaces are to be ordered at once, but the construction will not be completed before next spring. A converter is also being installed in connection with the enlargement now in progress.

NEW ZEALAND.

At the New Scotia G. M. Co.'s cyanide plant, Reefton, 2800 tons of tailings were treated during a period of six months from November, 1900, to May, 1901, yielding £1962 12s (£9810), equal to 14s 3d (\$3.31) per ton; less working expenses per ton—supplies, 5d (10 cents) per ton; wages, 2s 1d (50 cents) per ton; cartage and sundries, 1 1/2d (3 1/2 cents) per ton; commission, 6 1/2d (12 1/2 cents) per ton; government royalty, 2 1/2d (5 cents) per ton; cyanide, 3s 5d (82 cents) per ton; zinc, 2 1/2d (4 1/2 cents) per ton; leaving a net profit of 7s 3d (\$1.68 1/2) per ton of sand treated. The total profit was £985 (\$4900). The plant—three 50-ton leaching vats and two sump tanks—is situated close to the battery, thus minimizing working costs. The superintendent reports that the residues after treatment only assayed from 70 cents to \$1.30 of gold per ton. The total cost of the cyanide plant is £1012 17s 5d (\$5000) and its capacity 600 tons per month, allowing for continuous treatment.

Recently Declared Mining Dividends.

Commercial Paragraphs.

THE sun never sets on Cross oil filters. The Burt Mfg. Co. of Akron, Ohio, the manufacturers, report them in use in twenty-eight different countries. A shipment of them was recently made to Stockholm, Sweden.

IN the division of mines and metallurgy at the Buffalo Exposition silver medals have been awarded the Chamber of Commerce, Los Angeles, Cal.; L. B. Eaton & Co., Nevada; Kesseler Bros., San Francisco; F. R. Mellis, Baker City, Or.; Mine & Smelter Supply Co., Denver, Colo.; States of Nevada and Oregon; United States Marble Co., Spokane, Wash.; T. S. Wood, Leadville, Colo.; Woods Investment Co., Victor, Colo.

SOME INTEREST has of late been shown among engineers and others in charge of the large office buildings in St. Louis, Mo., regarding the length of service obtained from the different styles of wire rope in use on their elevators. In the Telephone building two elevators were equipped Jan. 1, 1891, with round-strand rope. The ropes on one of these elevators were replaced in July, 1895, and those of the other in February, 1897—after 4 1/2 and 6 years' service, respectively. A record even more remarkable than the above was made by the elevator ropes in the Mercantile Club, which were in use over seven years on freight and passenger elevators, the latter running late at night. The appearance and condition of the cables after this long service was fully as remarkable as their long life. There was not even a broken wire throughout their entire length, either inside or outside. These ropes had a breaking strain when new of 13,000 pounds. Samples of the worn rope after seven years of continuous service stood a test on a Riehle machine of 11,000 pounds—a loss of less than 20%. Samples of worn round-strand cables

showed a loss of from 25% to 33%—the greatest loss being on 3/4-inch diameter cables with all outside wires broken. Messrs. Broderick & Bascom of St. Louis, Mo., the manufacturers of the round-strand rope, are naturally much gratified with the showing made by their product. They state they have written statements from the owners of the buildings to verify the truth of the above tests.

Personal.

D. EVANS, of Tintic, Utah, is in Tonopah, Nevada.

A. P. MINEAR, of Ketchikan, Alaska, is sojourning at Hailey, Idaho.

C. LINDNER, of Jacksonville, Tuolumne county, Cal., is in New York.

P. C. STOEES of Wallace, Idaho, is examining mines in southeastern Alaska.

W. DUFFY, Supt. of the Sailor Canyon mine, Westville, Cal., is in San Francisco.

J. ROSS, Supt. Wildman-Mahoney mine at Sutter Creek, Cal., is in San Francisco.

F. JOHNSON has been appointed Supt. of the Deerhorn mine at Cripple Creek, Colo.

JOS. SNOW, of Newtown, El Dorado county, Cal., has returned from Nome, Alaska.

JESSE J. MACDONALD of Los Angeles, Cal., is in Denver, in connection with cyanide matters.

S. I. SILVERMAN, of Spokane, Wash., is at Coppermount, Prince of Wales island, Alaska.

O. P. POSEY of Salt Lake City, Utah, has returned there from a mine examining trip in Arizona.

ARTHUR HAUMAN, recently metallurgist Los Animas mine, Llano, Mexico, has returned to San Francisco.

CHAS. BUTTERS, who recently returned to Berkeley, Cal., from Europe, leaves this week for Salvador, C. A.

A. W. MCCUNE of Salt Lake City, Utah, has returned there from an examination of copper mines in Peru.

R. JONES, superintendent of the Canada Hill G. M. Co., of Placer county, Cal., is sojourning in San Francisco.

W. L. WATTS, returned from Humboldt county, Cal., pursues his oil reconnaissance at Santa Barbara, Cal.

B. F. JAMES, recently returned from South America, goes to take charge of a mining plant at Placerville, Cal.

E. C. ENGLEHARDT has returned to Denver, Colo., from a professional trip through Arizona and California.

E. RAMMELMEYER, of Nelson, B. C., has been appointed superintendent of the New Fairview M. Co., at Fairview, B. C.

F. HAMILTON of Cripple Creek, Colo., has been appointed manager of a large mining property near the City of Mexico.

P. PETIT, M. E., of Paris, France, who has been developing some mining property in Colombia, S. A., is in San Francisco.

J. CHIPMAN, of Tintic, Utah, has been elected superintendent of the Uncle Sam mine at that place, succeeding D. Evans, resigned.

R. J. FRECHEVILLE of London, Eng., director of the Le Roi M. Co., is at Rossland, B. C., examining affairs at the Le Roi mine.

A. L. WATSON has been appointed general foreman Newport Smelter, at Northport, Wash., succeeding Supt. D. C. Connolly, resigned.

H. SPENCE of Salt Lake City, Utah, is at the Balakalala copper mines, near Redding, Cal., in charge of diamond drill explorations in it.

W. F. MITCHELL, who has lately been examining copper mines in Shasta county, Cal., has returned to his home in Salt Lake City, Utah.

D. MACLAREN, consulting engineer of the Norman Proprietary G. Mines, Ltd., and Melvin Mines Syndicate, Ltd., of Australia, is in Cripple Creek, Colo., examining the mines of that district.

A. H. BROOKS and C. C. BRAYTON of the U. S. Geologic Survey have returned from Prince of Wales Island, where they have put in the summer making a survey of that territory, and have gone to Washington, D. C., to report.

H. L. DURDEN, for nineteen years curator of the museum of the California State Mining Bureau, is succeeded by Mr. Hyde. Mr. Durden has an honorable record for efficiency, and during the long period of his incumbency ably discharged the duties of that responsible position.

DR. DAVID T. DAY, who has charge of the department of mining and metallurgy at the St. Louis Exposition, has returned from San Francisco to New York City. While in San Francisco he appointed as his Pacific coast assistant Charles G. Yale of the San Francisco U. S. Mint.

Latest Market Reports.

SAN FRANCISCO, Oct. 10, 1901.

SILVER.—Per oz., Troy; London, 26 1/4 d (standard ounce, 925 fine); New York, bar silver, 57 1/2 c (1000 fine); San Francisco, 57 1/2 c Mexican dollars, 47 1/2 c San Francisco, 45 1/2 c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62 1/2; Casting, 1 to 3 casks, \$16.60; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22 1/2 c. London: £63 15s per ton.

LEAD.—New York, \$4.37 1/2; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5 1/2 c 1000 to 4000 lbs.; pipe 6, sheet 6 1/2, bar 5 1/2 c; pig, \$5.25. London, £11 5s 0d per ton=2.44 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton=3.58 1/2 cts. per lb.; San Francisco, ton lots, 5 1/2 c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 1/2 c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30 1/2 c; 500 lbs., 30 1/2 c; less, 31c; bar tin, \$3.35.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76 1/2 lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 1/2 c; slab, 5 1/2 c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

NICKEL.—New York, 50@60c per lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15 1/2 c.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

PLATINUM.—San Francisco, crude, \$19 1/2 oz.; New York, \$20.50 per Troy oz.

BISMUTH.—New York, \$3.10, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$1.95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2 c; less than one ton, 17 1/2 c. No. 1*, 60% carload lots, 13 1/2 c; less than one ton, 15 1/2 c. No. 1** 50%, carload lots, 11 1/2 c; less than one ton, 13 1/2 c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 1/2 c; less than one ton, 11 1/2 c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s; 16 oz., 40s., 9 1/2 c set; 14 oz., 40s., 8 1/2 c.

OILS.—Linsed, pure, boiled, bbl., 74c; cs., 79c; raw, bbl., 74c; cs., 78c. Deodorized Stove Gasoline, bulk, 14 1/2 c; do., cs., 20 1/2 c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13 1/2 c; do., in cs., 19 1/2 c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50@52 1/2 c; cs., 55@57 1/2 c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 31 1/2 @ 32 1/2 c per lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2 1/2 @ 3c per lb.; blue vitriol, 5 1/2 @ 6 1/2 c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2 1/2 @ 2 1/2 c; California refined, 1 1/2 @ 2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING OCT. 1, 1901.

- 683,547.—CONCENTRATING BELT—W. F. Bowers, S. F.
 683,590.—SAW MILL—G. W. Brower, Portland, Or.
 683,644.—ORE SAMPLER—A. C. Calkins, Los Angeles, Cal.
 683,789.—CANN TESTING MACHINE—W. S. Case, Hayward, Cal.
 683,833.—PROOF ALBUM—S. Forbes, Berkeley, Cal.
 683,747.—FOOT WARMER—F. H. Gotsche, S. F.
 683,764.—NUT LOCK—H. R. Hopgood, Montone, Cal.
 683,779.—VELOCIPED—J. Lund, S. F.
 683,613.—GOLD SAVING APPARATUS—A. Marcotte, Gaston, Cal.
 683,655.—SECURING CAMS ON SHAFTS—E. H. Moyle, S. F.
 683,884.—WATER SEAL TRAP—T. F. Payne, Spokane, Wash.
 683,683.—ROCK DRILL—W. W. Waite, Colfax, Wash.
 683,827.—WINDOW VENTILATOR—D. E. Werts, Grants Pass, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICES FOR SECURING CARS OR LIKE HUBS UPON THEIR SHAFTS.—E. H. Moyle, San Francisco, Cal. No. 683,655. Oct. 1, 1901. The object of this invention is to provide a means for removably securing cars, pulleys and the like upon shafts. The shaft has an eccentric portion, and the hub has a bore and key-way therein extending longitudinally through one end of the hub. It also has an annular groove or channel and a segmental key in the key-way extending across this groove or channel and abutting against the side thereof. When the parts are turned in the desired direction, either the shaft driving the pulley or cam, or vice versa, the eccentric portion of the shaft acting in conjunction with the tapered segmental key, serves to bind the latter tightly between the shaft and the cam or pulley, and they are thus firmly locked as long as the parts are driven in that direction. To loosen the parts, force is applied to turn in the opposite direction until the key has been loosened in its seat.

CAN TESTING MACHINES.—W. S. Case, Hayward, Cal. No. 683,789. Oct. 1, 1901. This invention is designed to test the seams of cans after they have left the soldering machine to determine if they are air-tight. It comprises an endless conveyor with clamping devices between which the cans to be tested are received. An air reservoir, revolvable in unison with the pulleys carrying the conveyor, connections between this reservoir and the clamps, so that air under pressure may be ad-

mitted to the cans. The cans are submerged during the travel of the conveyor in a fluid-containing trough, and means are employed for holding the imperfect cans and delivering them separately from the perfect ones.

SITUATIONS WANTED.

An experienced mill man desires position in mill; understands Amalgamation, Concentration and Assaying. Address G. M., this office.

A first-class machinist, engineer and cyanide man wants situation. Ten years experience in cyanide plants; three years foreman; three years superintendent. Address reference. Box 93, this office.

WANTED.—Position as superintendent or general manager of a copper smelter or Bessemer plant. Eighteen years' experience. Speak Spanish. Thorough knowledge of carbonate or sulphide ores. References exchanged. Address Box 601, care Mining and Scientific Press.

WANTED.—Position by a practical mine foreman in America or Mexico. Have twenty-one years' experience in gold, silver, copper, lead and zinc mines. Speak Spanish. Have best of recommendations. Modest salary required. Address J. R. H., care Mining and Scientific Press.

WANTED.—SITUATION BY A PRACTICAL mill man, assayer and cyanide man; is also a practical miner. Understands mine bookkeeping. No objection to Mexico. Best of references. Address W., care Mining and Scientific Press office.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

MINING ENGINEER, graduate Mass. Inst. Tech., with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

A. M. DONALDSON & CO.,
Assayers and Waste Product Smelters,
1661 Larimer St., Denver, Colo.

Pay Cash for Mill Wastes, Iron Amalgam Chips, Gold and Silver Refractories, Old and Surplus Quick-Ver, Gold and Silver Wastes. ZINC SEAVING MANUFACTURE. Fresh cut always in stock. TELEGRAPH orders solicited.

WANTED IMMEDIATELY.
A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop. Excellent chance for the right man to better his position, if satisfactory. Answer by letter to P. C. JURS, 1149 Van Ness Ave., San Francisco.

IRIDOSMIUM,

one of the PLATINUM METALS and invariably associated with it and usually with gold in placer and beach mines, has now considerable market value. It is tin-white, heavier than gold and occurs in small scales. For information about saving IRIDOSMIUM and PLATINUM, write to the Waratah Minerals Company, Limited, 140 Ellis St., San Francisco, Cal. For sale, send them to Welsbach Company, Broad and Arch Sts., Philadelphia, Pa. Analysis free.

BRITISH COLUMBIA MINES.

Mines and prospects in British Columbia and the Northwestern States.

Free-milling Gold properties on very reasonable terms.

Excellent chance for profitable investment in legitimate mining.

Correspondence solicited.

Address ANDREW F. ROSENBERGER, P. O. Box 700, Nelson, British Columbia.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from G. F. Edwards, in the Philo Haven Consolidated Placer Mine, near Gold Lake, Sierra Co., to deposit tailings in Mud Lake, which drains into Frazier Creek; from the Purdy Creek Mining Co., in the Purdy Creek Mine, near Frenchtown, Yuba Co., to deposit tailings in Purdy Creek; from Edward Bryan, in the Chaparral Hill Gold Gravel Mine, near Onion Valley, Plumas Co., to deposit tailings in Borg Creek; and from the Norwegian Mining Co., in their mine near Tuttle-town, Tuolumne Co., to deposit tailings in Rock Creek, in the South Honcut Mine, in Yuba Co., near Bangor, to deposit tailings in South Honcut Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on October 21, 1901, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from the Calaveras Mining, Water & Power Co., in the Johnston and Scott Hill Mines, near San Andreas, Calaveras Co., to deposit tailings in Willow Creek; from Chas. Hilton, in the Calaveras Hill Mine, at Calaveritas, Calaveras Co., to deposit tailings in gulches draining into O'Neill and San Antonio Creeks; and from Manuel Lualaba and Co., in the South Honcut Mine, in Yuba Co., near Bangor, to deposit tailings in South Honcut Creek, gives notice that a meeting will be held in Room 59, Flood Building, San Francisco, Cal., on Oct. 28, 1901, at 1:30 P. M.

**Soft
Harness**

You can make your harness as soft as a glove and as tough as wire by using EUREKA Harness Oil. You can lengthen its life—make it last twice as long as it ordinarily would.

**EUREKA
Harness Oil**

makes a poor looking harness like new. Made of pure, heavy bodied oil, especially prepared to withstand the weather.

Sold everywhere in cans—all sizes.

Made by STANDARD OIL CO.

ONCE IN A LIFE TIME

is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON

lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight of stagger spokes and wide tires. Wheels any height from 25 to 60 in. It lasts because tires can't get loose, no setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel hounds. Don't buy a wagon until you get our free book, "Farm Savings." ELECTRIC WHEEL CO., Box 229, Quincy, Ill.

THOUSANDS NOW IN DAILY USE.

ASSESSMENT NOTICES.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1901, an assessment (No. 2) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 56, 120 Sutter Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on MONDAY, the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.
120 Sutter Street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 24) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

MARINA MARSHOAN GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of September, 1901, an assessment (No. 25) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

CHAS. BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

TANANA MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of September, 1901, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

EDWARD H. STERN, Secretary.
Office—Room 801 Claus Spreckels Building, San Francisco, California.

THE THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of October, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 632 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. FREY, Secretary.
Office—632 Sacramento street, San Francisco, California.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

30in. x 72in.
Direct Acting
Hoisting
Engine

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

"THE DANIEL BEST" 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

PATENTED.

AMALGAM PLATE CLEANERS.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeannesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeannesville Pumps.

We claim that in Jeannesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

30 to 40 SPEAR ST., Bet. Market and Mission,
SAN FRANCISCO, CAL.

NON-SHRINKABLE TANKS,
Mining, Water, Oil, Railroad and Wine.

GENERAL MILL WORK AND MOULDINGS.

We claim the Non-Shrinkable Tank with water channels to be the most perfect in the market. There are two transverse holes all around the tank in the middle of the stave, one near the top and one near the bottom. The staves are all grooved from the top hole to the bottom hole, which insures the filling of water between every stave. This will keep the staves water-soaked without regard to whether there is water in the tank or not; so the oil can be pumped completely out of the tank and left to stand for a period; and when the tank is again filled with oil there will be a tight tank, because of the water in the channels and transverse holes of the staves keeping them moist and prevents leaking. There is no possibility for the water to mix with the oil, because the water can be discharged to whatever place is desired.
In mining tanks there is no loss of solution with these water channels.

P & B

You had better be thinking about roofing your building before the severe storms come—you had better write us for full information about P & B Ready Roofing.

We would be glad to tell you all about it—how it will protect your building from the storms, snow, rain, cold, heat, gases, acids, fumes, sulphur smoke, and all injurious elements.

We would be glad to tell you how it comes in rolls, easily and conveniently handled, cheaply transported—how it can be applied by anyone without a technical knowledge, and in fact, we would be glad to tell you why P & B Ready Roofing is the best roofing for your building.

For 16 years this roofing has been used on the best buildings by the most experienced builders, and during that time P & B Ready Roofing has proven beyond any question its value as a perfect roofing.

A large space can be covered very quickly with P & B Ready Roofing, either on flat or steep roofs.

Write right away—we will be glad to send you full information. Address Department A in order to secure a prompt response.

A GOOD INVESTMENT.

Three Dollars brings this paper
one year—fifty-two issues. Can
you afford to be without it?

DO YOU VALUE LIFE AND PROPERTY?

We presume you do! Then why not use a hoist that is absolutely safe; that CANNOT BACK-SLIDE as long as the rope holds out?

THE DAVIS AUTOMATIC SAFETY-BRAKE HORSE HOISTER.

is built for safety; the control of the brake is automatic and positive. No ratchets or gear teeth to break or become worn. The friction by which the raising and lowering is governed is simple yet powerful.

Our 142-page Catalogue tells you all about this and other machinery

THE F. M. DAVIS IRON WORKS CO., DENVER, COLO., U. S. A.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.

TESTING WORKS, 1716 BLAKE ST.

Iron and Steel Manufacture on the Pacific Coast.

The possibilities for profit from iron and steel manufacture on the Pacific coast seem now to be sufficiently close to realization to make their discussion timely and pertinent. The old conditions, which made the early attempts in the industry failures, have given place to new conditions which would tend to make the business successful. Consumers of iron and steel will buy where they can buy cheapest. The problem on the Pacific coast for local iron and steel manufacture is solely the supply to consumers on the Pacific coast and points reached by water routes from it of these metals cheaper than their manufacture elsewhere can supply the consumers. This, then, involves a comparison of costs.

Iron and steel are manufactured in Pittsburg at a flat operative cost, which does not include any profits or earnings on capital, of \$7.50 and \$12.50 a ton, respectively. These are the lowest figures, and \$8.50 and \$14 would be closer ordinary practice. Taking the lowest figures above, and adding freight by rail to the Pacific coast, which amounts to \$13.40 a ton, the present flat costs at point of delivery to the consumer are \$20.90 and \$25.90 a ton, respectively. Sea freights via Cape Horn added to rail freights from Pittsburg to the Atlantic could not lessen these figures much. It is possible that rail freights could be reduced to \$10 a ton, making the respective costs per ton for iron and steel \$17.50 and \$22.50 at the point of delivery to consumers. These last it would seem can be considered the figures of flat costs which Pacific coast manufacture can rise to and still be on even terms with Pittsburg manufacture.

For the Trans-pacific markets in China, Japan, Siberia and the Philippines, the present sea freight

charges for transportation from Pittsburg via New York and Suez canal average \$12.50 a ton. Reducing the charges, which pay profits, to the flat costs, which the ownership of the steamship lines by the iron and steel manufacturing businesses would bring, the transportation per ton from Pittsburg would cost by rail to New York \$2.40, by water not less than \$6.50—a total of \$8.90. This last figure added to the Pittsburg costs makes the cost at the points of consumption in the Orient \$16.40 and \$21.40 a ton, respectively. Present freight charges from the Pacific coast to the countries across the Pacific average about \$10 a ton. These charges reduced to flat costs can be reduced to \$3, provided a return freight business is developed. A return freight business already exists by the Suez route. Here it has to be made. This return freight business can be made by the transportation of coke for use in the manufacture of the iron and steel. Coke can be made in China and Siberia, possibly in Korea as well, to cost on board ship \$1.50 a ton or less. Adding to this \$3 for freight and 75 cents for import duty the cost of coke at the blast furnaces would be \$5.25 a ton. With the freight on iron and steel from the Pacific coast to the eastern Asia countries costing \$3 a ton, the cost of manufacture here to be even with Pittsburg would be \$13.40 for iron and \$18.40 for steel.

Hillside Mine, Bristol, Lincoln County, Nevada. (See page 164.)

These last figures, it would seem, can safely be taken as an upper limit of cost of manufacture on the Pacific coast to successfully compete with manufacture at Pittsburg. They are \$5.90 a ton higher than the Pittsburg costs. The Pacific coast has iron ore deposits of enormous extent and superior quality. They can be laid down at the blast furnace as cheap as at Pittsburg. The same mechanical economies that have reduced costs at Pittsburg are equally practicable here. The difference in the end then comes down to the difference in the cost of labor and of fuel. With coke from China or Siberia at \$5.25 a ton the difference in fuel cost would be per ton of iron between \$3.50 and \$4. The difference in labor cost which would have a constant tendency to disappear could not exceed 75 cents a ton. Deducting these two from the \$5.90 margin, there is still a possible margin in flat competitive costs in the common Oriental market of \$1.25 to \$1.50 a ton. In the Pacific coast market the possible margin is from \$2.35 to \$2.60 a ton.

The preceding has considered the entire proposition of iron and steel manufacture on this coast from the safe standpoint of the known. It is possible and probable that Alaska may be able to supply coke at a lower cost than the Chinese estimated on. It is possible that California petroleum may be successfully used as a substitute for coke and at a lower cost. In either case the Pacific coast industry would not have to take into account the Asiatic market, but could be developed for the home market. British Columbia coke from Crow's Pass could hardly be delivered on the Pacific coast cheap enough to keep the cost of iron and steel production within the limits noted above.

A Parasitic Mining Scheme.

A short time since the MINING AND SCIENTIFIC PRESS had an examination made, at a considerable expense, of the Ketchikan district, in southeastern Alaska, by a mining engineer, and published his report in this journal. In doing so it followed out its uniform policy of obtaining and publishing, in the early period of a new district, accurate technical and commercial information regarding it.

The enterprise of this journal has been promptly appreciated by the theft of the article and its mutilation to promote the sale of one of the parasitic stock swindling schemes that breed on the opportunities to dishonestly offered by new mining districts. From The Mining Journal, published in Ketchikan, Alaska, is quoted the following:

The Gold Coin Mining Company has raised the price of its stock from 7 to 15 cents per share. If there has been any development on the property to warrant such an advance, The Mining Journal is not aware of it. The fact is that, though this company (the home office of which is at Tacoma, Wash.) has been peddling out its stock for two years or more, no more than the annual assessment work has ever been done on any of its claims. The concern begins to smell bad, and it would be just as well for those who are solicited to buy its shares to take time for investigation. This plain statement of the truth is prompted by the dishonesty of a Seattle, Wash., mining publication, which, having appropriated as its own the very able paper descriptive of the Ketchikan district recently printed in the MINING AND SCIENTIFIC PRESS, an installment of which appears on this page, is guilty of still greater dishonesty in that it incorporates in the stolen article a lying statement referring directly to the Gold Coin, that "active development work is being done on this mine, which gives promise of being one of the big dividend payers of the district." The truth is, as we have stated, no development work has ever been done on the Gold Coin property; that company has no mine or mines, nothing in fact that gives promise of becoming one of the big dividend payers of the district. So far this year it has not even done the assessment work required by law. It has absolutely nothing which will justify the sale of shares at any price whatever—not as much, at least, as hundreds of individual claim owners who have equally as good prospects in better state of development. The property may, with a sufficient amount of money judiciously expended, be developed into a profitable mine. The company, to say the least, is slow to prove its faith by its works in that direction.

Nothing can be added to the vigorous condemnation of the Gold Coin Mining Company made by the local journal. It states the facts regarding the pretended mines and lack of even pretense of mining.

This paper can only regret that its carefully prepared paper on the Ketchikan district, which did not mention the Gold Coin Mining Company, should have led it into the error of taking itself seriously. The promoters in Tacoma, Wash., last year used the stock for tips to barbers, bootblacks and restaurant waitresses. Seven cents or fifteen cents a share, clearly the Tacoma mine for the promoters is more dividend paying than the Gold Coin mine to the stockholders.

Economic Geology of California.

There are some interesting problems to be worked out in the geology of California, particularly in the relations of the areal geology to the economic, as the U. S. Geologic Survey differentiates the phenomena. Much has been done in this direction with the opportunity offered by the Mother Lode system, and some very excellent deductive work has been accomplished with small areas like the Grass Valley and Ophir Quartz districts. All of it together is, however, but a good beginning, in comparison with the magnitude of the field.

Considering only the northern and central portions of the State, the region of the Sierra Nevada mountains is characterized with a series of lode systems, each a duplicate of the Mother Lode system in the general lines of fissuring. That is to say, the Mother Lode system of metal-bearing quartz veins is one of a type merely, distinguished only by differences in degree. These systems of lodes have a general parallelism of strike, and are notably parallel in strike to the main axis of uplift of the mountains. The general direction of this strike is north-northwest and south-southeast. Another characteristic is also observable. The extreme western vein system, belt or line of ore deposits is distinctively copper-bearing, while the other systems are equally distinctively gold-bearing, with a possible exception to this in the extreme eastern system of lodes, developed in Plumas county and extending into Washoe county of Nevada, which is again distinctively copper-bearing. Locally there are some minor systems of gold-bearing lodes running with the two distinctive copper-bearing systems; and, on the other hand, there are some copper-bearing veins running with the several great gold-bearing lode systems. The exceptions, however, do not tend to minimize the suggestion of the dominant mineralization in either case.

Northwestern California has a mountain system, as a geological entity, entirely separate from the Sierra Nevada mountains. Generally designated as the Coast Range, the more specific name would be the Klamath mountain system. Unlike the Sierra Nevada, it has several lines of uplift. These are roughly parallel to each other and have generally, but not exclusively, the same north-northwest and south-southeast strike as the main axis of the Sierra Nevada mountains. The metal-bearing deposits are, as in the case of the Sierra Nevada mountains, concentrated into several lines or bands of lodes. Like the condition in the other range, these lines or belts are roughly parallel to each other; but, unlike the Sierra system, they are not parallel to the lines of mountain uplift, but cross them at a sharp angle. The general direction of the Klamath mountain lode systems is north-northeast and south-southwest. This difference is suggestive of a greater age to the lode deposits than to the present mountain ranges, and undoubtedly has some bearing on the exceptional location topographically of some of the ancient gold-bearing gravels. The Klamath systems of lodes as a whole seem to show the same peculiarity as the Sierra systems. The extreme western and extreme eastern lines or belts are distinctively copper-bearing, and the intermediate systems are distinctively gold-bearing.

The extreme western line is so little known and explored that it has hardly been thought of yet as a "copper belt." Its southern end is not yet certainly known with exactness, but is either in central Humboldt county or possibly as far south as northern Mendocino county. Thence the belt extends north northeasterly, crossing the Trinity river and through the Red Top creek country, thence crossing northwestern Siskiyou county into southern Oregon in Josephine county. In this last district—Josephine county, Oregon—there has been considerable exploration and some exploitation. One furnace has been built and

operated. Lately discoveries have been made in Siskiyou county close to the State line. There are a number of late discoveries in Humboldt county, but there is the greater portion of the belt between the extremes which is as yet entirely unknown because entirely unexplored. It is a region which has not been prospected over for over thirty years, and possibly for a longer period. The residents, who are very few in number, have not prospected it, though they have found, as an incident of their residence, considerable rich copper-bearing float, without finding its lode source. The deterrent feature is the topography of the country and the absence of transportation facilities. There are not even roads in this middle section of this belt. Josephine county in Oregon and central Humboldt in California, having the beginnings of a transportation service, have received more attention from prospectors and miners. There is a possibility that there is in addition to the copper belt described another one still farther west in Del Norte county of California and Coos county of Oregon. A number of copper lode discoveries and developments seem to indicate this.

The extreme eastern lode system, or, rather, the two extreme eastern lines of lode deposits, are, like the extreme western, distinctly copper-bearing. Both of these are in Shasta county, California. The one first developed is in evidence at Iron Mountain, Balakalala, and in the Backbone creek copper-bearing deposits. The other includes the Bully Hill and the lodes found on Pitt river and north of it. The enormous economic development on both of these lines or copper belts is well known and their value well established. That the limits for exploration and prospecting have not been entirely covered also seems probable. This is not so much the case with the Iron Mountain copper belt as with the Bully Hill belt. It seems clearly worth the effort, for the chances of success offered, to prospect in the line of the Bully Hill copper belt to the northeast and perhaps to the southwest.

It is not probable that any great linear extent will be found. The direction of the strike may be considered as conclusive against this. Followed out, it leads into the vast mass of lava rocks which bury thousands of feet deep the older metal-bearing series. There seems no reasonable possibility of the existence of two parallel north-northwest and south-southeast copper belts extending from central Shasta county to southern Oregon, and there connecting through a curve. This theory appears to have the semi-official endorsement of the California State Mining Bureau, but its acceptance should certainly be qualified until the evidence on which it is based is declared. Meanwhile and afterward there remains the very interesting problem of the relation of the areal and economic geology of the California region for the study of geologists and miners. Enough has been said here to indicate that the solution can be made to return pecuniary rewards.

The annual report of the U. S. Geological Survey on the mineral resources of the United States shows some interesting facts, among others that the general prosperity of the country is affected by the condition of the country's basic industry; that when miners prosper the country prospers, and that when the mining industry languishes there are "hard times" all over the country. The two panic years of 1893 and 1894 are shown by the received U. S. Geological Survey report to have been years when there was a decline in the value of mineral products, and coincident with the increase in the country's mineral production in 1895 came increased wealth, work and general prosperity. The report shows that every year since 1891 there has been an increase in the annual gold output of the country, and that despite the fact that silver is about eliminated from politics it is by no means eliminated from the precious metal output, the production for the last fiscal year being within 333,457 ounces of the great 60,000,000-ounce production of 1893. The report deals with big figures, showing that the value of the mineral products of the country in 1900 was considerably over one thousand millions of dollars; and in this furnishes an unanswerable argument for the creation of a cabinet department, a bureau of mines and mining. Nothing has done more for the nation than the mining industry. Nothing has had less aid from the nation than the mining industry.

Concentrates.

IRIDIUM is the least expandable and zinc the most expandable of the metals in ordinary industrial use.

PLATINUM electrodes in a gasoline explosion engine do not become coated with unburned carbon from the vapor.

The Russian Government is reported to be preparing to patrol the Siberian coast on Behrings sea with war vessels to keep out American miners.

THE Transiberian Railroad, from St. Petersburg in Europe to Vladivostok on the Pacific ocean, is to be opened over its entire length on Nov. 8th.

THE switches of large currents of high voltage are broken in oil in order to prevent the formation of a destructive spark during the process of switching.

COKE made from Crow's Nest Pass, B. C., coal has been made which contains 91.97% carbon and 8.03% ash, as compared with Connelville, Pa., coke containing 86.88% carbon and 11.54% ash.

THERE is an alloy of nickel and iron, containing 36% of the former, which has but one-tenth of the expandability of platinum and one-thirteenth or one-fourteenth the expandability of iron or of nickel.

THE usual allowance of candles to a miner is two to a shift, sometimes three. A hard candle, burning with a short, clear flame, is more economical than softer grades that burn with long flames and smoke in air currents.

THE Colorado production of gold up to January 1st, 1901, is estimated at \$252,000,000, silver \$353,000,000, lead \$101,000,000, copper \$14,000,000; total \$720,000,000. The production of Cripple Creek district to date is \$113,859,287.

NICKEL STEEL WIRE used as a measuring tape will give a precision of rapid measurement of distances that is not possible with the steel wire tapes, owing to the latter being much more affected by changes of temperature.

HYDRAULIC MINING in Colorado tributaries of the Arkansas river has muddied the river water to an extent that the towns below dependent on the stream for their town water supplies are beginning proceedings to stop the mining.

THE Bay Counties Power Co. is transmitting an electric current for commercial power purposes from its generating station at Colgate, Yuba county, Cal., via Oakland to Stockton, Cal., a distance of something over 200 miles. This makes it the longest transmission line in the world. It cannot be regarded as the limit.

THE tenth annual convention of the California State Miners' Association will begin on the 21st inst., at Golden Gate Hall, 625 Sutter St., San Francisco, Cal. From the reports of the various county miners' associations, Secretary Benjamin expects that the attendance this year will be the largest in the history of the Association.

PLATINUM is the only known metal around which glass can be fused successfully. Without being conclusive, it would seem that it might be possible among the alloys of nickel and steel to find one having exactly the same expandability as glass, with a higher fusing point, which would then permit of the fusing of glass around it.

THE electrolytic process for making soda and bleaching powder is considered as having a superiority over the Le Blanc process, in that the product is much purer. There is no hydrochloric acid produced to make calcium chloride, and the 1% or 2% of impurity in the salt produced electrolytically consists only of sodium chloride, sulphide and sulphate. The latter impurity has been found in the commercial soda made by the Le Blanc process as high as 25%.

SILLS to timber sets in tunnels that cut through rock firm enough to hold up the posts are seldom placed. They are only occasionally used in drifts in gravel where the latter is at all compact. They are of no special advantage in swelling ground. It is preferable to let the ground have the floor of a drift to rise into. It relieves some of the strain on the post and cap timbers and the lifted rock can be easily removed from the floor by the pick and shovel.

IRON ORE has been found on a number of islands in Hudson bay off from the coast of Ungava by an exploration party. The district is little known, but will become accessible by the construction of a railroad from Winnipeg to James bay. Copper was discovered in 1897 in large quantities in the region west of Hudson bay, and between it and Great Bear lake. The deposits would require a railroad to Hudson bay to make them available. The country is said to be practicable for its construction.

THE cost of water power plants based on figures stated for Eastern United States and foreign installations averages between \$40 and \$60 per horse power, exclusive of dam construction, and with it included from \$60 to \$100 per horse power. While these figures are a rough guide for considering in the preliminary stage such propositions, they cannot be considered conclusive. Each proposed water power plant is economically only to be considered finally on the data of a special engineering investigation made of it.

THE total energy in each of two pounds of air is exactly the same, independent of the pressure on each, if the temperature is the same. The amount of available energy differs with the pressure. There is no machine

by which the energy in a pound of air at atmospheric pressure and 60° F. temperature can be commercially converted into work. For the pound of air at 60° F. temperature and 100 pounds to the square inch pressure there are many machines which will convert a portion of the energy into work.

STANDARD sizes and types of machinery for service about a mine and mill are to be preferred to special sizes or types. Duplicates of parts and of entire machines, in cases of urgent necessity arising from breakdowns—and such necessities about a mine or mill are always urgent—can almost invariably be obtained from stock without delay, while with special designs or sizes the required duplicates have to be made at the cost of considerable delay. It is wisest to plan in the first place so as to use standard sizes and types.

NATURAL CEMENT ROCK is an impure limestone which contains the proportions of lime and silica or clay which would be mixed to make a Portland cement. An impure limestone containing 45% of lime, 25% of silica, 5% of magnesia and 7% of iron oxide is a natural cement rock. Cement is made from it by grinding, burning and regrounding. It is less costly than Portland cement and will not stand the same physical tests. For certain classes of work it is a satisfactory material and has the advantage of cheapness over the Portland cement.

THE popular idea is that steel, such for example as rails are made of, is iron with some carbon. As a fact, however, the chemical analysis of steel will show other elements. An analysis that is typical gave, besides iron, carbon 0.521 of 1%, phosphorus 0.10 of 1%, manganese 1.05%, silicon 0.108 of 1%, sulphur 0.047 of 1% and copper 0.064%. These percentages are very small as percentages, but mean that in a ton of that steel there are 10.42 pounds of carbon, 2 pounds of phosphorus, 21 pounds of manganese, 2.16 pounds of silicon and 1.28 pounds of copper.

THE Supreme Court of California decision invalidating the new Code of Civil Procedure practically carries the same conclusion as to the Civil Code. The effect will be to nullify the provision which has been made for replacing lost stock certificates, and it may restore the old law of incorporation of mining companies. Under the old code, the fee of incorporation to be paid the Secretary of State is only \$10, no matter what the capital stock of the company amounts to. There should be quite a business in forming incorporations to supply the market after a statute increases the fees.

THE law regulating the appropriation of water in Montana is as follows: The person desiring to appropriate must post a notice in a conspicuous place at the point of intended diversion, and in this notice must state (1) the number of inches claimed; (2) the purpose for which claimed and the place of use; (3) the means of diversion, with size of flume, ditch or pipe; (4) the date of appropriation; (5) the name of the appropriator. Work must be begun within forty days and prosecuted with reasonable diligence. If the ditch constructed is too small to carry the amount of water appropriated the remainder is open to appropriation by another. No person can divert more than he has actually use for, no matter what his right is, if other parties with water rights want it.

THE riparian law of stream water flow, which is part of the old English common law, and as such has been transplanted to this country, is not as arbitrarily construed in denying the right of appropriation in England, where it originated, as here, where it comes in conflict with the State statutes granting rights of appropriation. In practice in England the riparian law is construed liberally. Compensation in kind is legal and its quantity the subject of contract or legal adjudication between conflicting interests. English practice permits the storage of water from flood surplus flows, provided that from the storage a normal low water flow be maintained. A water appropriator can store all the flow of a stream in one or several reservoirs and employ only one or part of one to make the compensating flow to the stream in the low water period.

THE word "can't" was left out of the engineer's dictionary many years since. The way to learn to do a thing is to do it. It is not the entire way, however. The beginner who would in the end lead must not only be able to do himself, but he must be able to guide others. This means the use of the brain, as well as the hand and the eye. It means study of what others have done and the intelligent understanding of what is studied. The beginner must realize, too, that it can never be all learned. There will always be more and more to learn ahead that study will save the doing of by the labor of the hands. The beginner must cheerfully realize from the beginning that he can put no hard and fast limit on the hours of study and work if in the end he would lead. Success and leadership in industry do not come to him who waits or lags, but to him who goes and does continuously and understandingly.

IN the cooling of steel the iron crystallizes out and the impurities concentrate in the more liquid or plastic portion, which on solidification forms a cement between the crystals which binds the whole together. The rate of cooling governs the size of the crystals in the first instance, and the reheating and annealing afterwards. The relative condition of the crystals and cement governs the adaptability of the mass to mechanical treatment, such as rolling and forging. Thus in cooling from solidifying point the cement is softer than the crystals at the

high temperatures, and consequently the harder crystals will flow in it under pressure and the mass can be easily worked; but the crystals are large and the grain coarse, and not perhaps coherent, so that the metal may be easily broken by shock. At a lower temperature the cement and crystals are of equal hardness, and any work, if heavy enough, on the metal breaks up the crystals or grain, and the material becomes tough through the interlocking of the two constituents. This temperature for a soft steel is probably about 1000° C., or an orange or bright red. At a still lower temperature, about 350° C., or blue heat, the stage of minimum plasticity is reached, and any work at this stage sets up strains through want of adjustment, and renders the metal liable to fracture. At or below straw heat, 250° C., steel becomes more plastic than at blue heat.

THE use of the word "crude" to describe the mining methods and apparatus of the early placer miners in California, or indeed anywhere else, seems inappropriate. The word "simple" would be more appropriate. The methods and apparatus that the old miners used obtained the gold that it was their purpose to get, and no methods or appliances could do more. They did not work all the placers, however, simply because the ones left would not pay wages to labor while now they can pay income to capital invested in complex specialized machinery. It may be well, therefore, to term the old methods, which it is well to remember are invariably the first used at any new discovery, "simple," in distinction from methods employed on other placers which are the reverse of simple. The word "crude" infers known inefficiency which can be expressed better by using just those words.

THE U. S. courts, in a West Virginia case, have ruled that an oil and gas lease in which the sole compensation to the lessor is a share of the product is not a grant of property in the oil or in the land until oil is actually produced, but merely of the right of possession for the purpose of exploration and development; and there is always an implied, if not an expressed, covenant for diligent search and operation. Under such a covenant where the lease contains a proviso requiring the lessee to commence and complete a well on the property within a specified time, such proviso and the time of its performance are of the essence of the contract, and it constitutes a condition precedent to the vesting of any estate in the lessee, without regard to the grammatical construction of the instrument. When the lessee makes no attempt to comply with such provision and evidences no intention to do so, at the expiration of the time stipulated the lease becomes forfeitable, at the option of the lessor, although by its terms it is for a definite term of years.

WHEREVER one operation can be so arranged to perform two or more useful services at less cost than the cost of the two services separately, an economy has been made. What is termed by-product production is of this nature. Coke is made by distilling the volatile matter away from coal. Recovering the products of distillation which have heretofore been wasted, a saving is made which reduces the cost of the coke. The use of the water pumped from a mine to supply power to operate the pump is an economy of this description. Liquefied air as such has been found to be too expensive of production to be commercially valuable on a large scale, but used as an intermediate stage it separates oxygen from the air for industrial use at a marvelously low cost. The process of electroplating with copper can be used with what are termed cathode bars of unrefined copper so as to effect the electrolytic refining by separating the silver and gold. This economizes to the extent that of two electrolytic depositions of the copper using power, one is saved, together with a cent of cost a pound.

THE "bucking" or difficulty had with starting up gasoline engines is very often due to the poor quality of the gasoline. Gasoline is one of the light gravity oils obtained from the fractional distillation of petroleum. Its standard gravity is 74 Baume. It should be uniform in quality, but the commercial gasoline is not. Frequently, as a result of the intentional mixing of two or more oils of less and more gravity, the standard gravity is made 74. Still more often the fractional distillation of the petroleum is so conducted that two or more oils, including some of less gravity and some of more gravity, are collected together and sold as gasoline, having the standard gravity. In use, starting with a full tank of commercial gasoline of the standard gravity, the material really being the mixture described, the engine starts without trouble. As it continues to run, there goes on in the carburetor chamber a fractional vaporization, the lighter oils separating out and being carried by the air into the explosion chamber. The heavier oils accumulate in the carburetor. So long as the engine is kept running and kept hot, the carbureted mixture continues to explode. If the engine gets cold and the attempt is made to start up again, it may "buck" and refuse to go, because the heavy oil vapor mixture cannot be exploded cold. The remedy is to avoid the difficulty by buying gasoline which is actually standard, and not a mixture which has the standard gravity as an accident. If the mistake is made of having the inferior article of gasoline, and the "bucking" can be suspected to be due to its defective quality, remove what is left in the tank and refill with a fresh supply. A very rapid blackening of the electrodes indicates an unduly heavy oil being exploded. By arranging a heating attachment so that the temperature of a heavy oil is increased, its vapor mixture can be made hot enough to explode when it would not explode cold.

The Title to Lodes in Patented Placer Claims.

The Supreme Court of California has just handed down a decision on this point in the case of the Cranes Gulch M. Co., plaintiff and respondent, vs. J. Scherrer et al., defendants and appellants, on appeal from the Superior Court of El Dorado county. The court's decision is as follows:

Action to quiet title to mining ground. Plaintiff claims under a patent for a placer mine, dated July 1, 1872. The defendants claim under a lode location made in 1897. Plaintiff's patent was based upon proceedings instituted May 9, 1871, and upon final entry and payment made Feb. 14, 1872.

The rights of plaintiff had their inception under what is usually called the Placer Act, dated July 9, 1870. This Act, though not repealed, was amended by adding a reservation of known lodes, and in some other respects by the Act of May 10, 1872, sometimes called the General Mining Act. In Section 10 it was enacted that the Placer Act should continue in force, except as to the proceedings to obtain a patent, which, it was provided, "shall be similar to the proceedings prescribed by Sections 6 and 7 of this Act for obtaining patents to vein or lode claims." It was further enacted in the same section, that all placer claims thereafter located should conform to legal subdivisions of public land surveys; "provided that proceedings now pending may be prosecuted to their final determination under existing laws; but the provisions of this Act, when not in conflict with existing laws, shall apply to such cases."

Defendants claimed under a location made of a lode some twenty-six years after the issuance of the patent. It is contended that the lode was a known lode when the application for the patent was made in 1871. The patent contained the usual reservation found in all patents issued under the Act of 1872, of veins or lodes known to exist at its date, within the described premises. Defendants had no claim to the premises at the date of the passage of the Act of 1872, or prior to 1897. It does not appear that there was any adverse claim to the placer location prior to that time.

Sections 6 and 7 contain rather elaborate provisions in regard to the application for a patent and for a contest. Section 11 provides for the case where a placer claim contains a lode within its boundaries. The placer claimant may purchase the lode if he chooses; but if a lode is known to exist within the placer, "an application for a patent for such placer claim, which does not include an application for the vein or lode claim, shall be construed as a conclusive declaration that the claimant of the placer claim has no right to the vein or lode claim; but when the existence of a vein or lode in a placer claim is not known, a patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof."

The first question of interest here is, does Section 11 apply to plaintiff's location, and does it authorize the reservation contained in the patent? It may be conceded that where no application for a patent had been made by a placer claimant, whose location and occupation were such that he could have inaugurated proceedings for a patent before the Act of 1872 was passed, he would be compelled to proceed under Section 11, and that the Act made his patent subject to the conditions there expressed. Possibly this would be true as to applications pending when the last Act was passed, provided payment had not been made and a certificate issued, but to make it apply to a claim when a certificate of purchase has been issued, before the Act of 1872 was passed, so as to include these reservations, would violate the provisions in Section 16 of the Act, "that nothing contained in this Act shall be construed to impair, in any way, rights or interests in mining property acquired under existing laws."

Upon payment of the price and its acceptance the applicant becomes vested with a complete equitable title and to a patent, which will convey to him the legal title. He is the real owner of the mine. His right is complete; only the evidence of his right is withheld. It has been held: "When the price is paid the right to a patent immediately arises. If not issued at once, it is because the magnitude of the business in the office causes delay. But such delay in the mere administration of affairs does not diminish the rights flowing from the purchase, or cast additional burdens upon the purchaser, or expose him to the assaults of third parties." (Benson M. Co. vs. Alta M. Co., 145 U. S., 431. See also Stark vs. Starrs, 6 Wall., 402, and People vs. Shearer, 30 Cal., 645.)

One of the contentions of appellants upon this point, if I rightly grasp it, is that lodes did not pass by a patent issued for a placer claim under the Act of 1870. This is based largely upon the language of Section 12, as numbered in the amendatory Act: "Claims usually called 'placers,' including all forms of deposits, excepting veins of quartz and other rock in place, shall be subject to entry and patent under this Act," etc. And it is contended that it is to be construed as other sections of the Act, of which it is made a part, had been construed. The Act, it is contended, authorizes the sale to a lode claimant of one lode

only. He gets no land save such as is required for the convenient working of his lode. If another lode or a placer were found within land taken by a lode claimant under the Act of 1866, of which the Act of 1870 was amendatory, the lode claimant would have no right to the other lode or to the placer. So here, it is said, the Act of 1870 only authorized the sale of a placer claim. Without entering the land or getting a patent the claimant could hold and work out his mine, but to hold it he was required to comply with certain burdensome conditions. The patent, it is argued, merely gave him title to his claim and relieved him from the burdensome conditions. He then owned his claim freed from the conditions and the liability to lose it by abandonment. But what he claimed was the right to mine that placer, and in terms the statute confines his patent to that. And this position is much strengthened by the rule of construction which requires all grants from the Government to be construed favorably to the Government and against the grantee.

Furthermore, it is said the same Act provides for the purchase of a lode claim and land necessary for its working at the price of \$5 per acre, and it is provided that no patent issue for more than one vein or lode, which shall be expressed in the patent issued. It is strongly urged that Congress could not have intended, while so carefully providing that no one person should be permitted to purchase more than one lode, to permit in another section of the same statute anyone to purchase a tract of land which may include many lodes at one-half the price per acre charged for lode claims.

All this is very plausible and persuasive, but the statute clearly authorizes the sale of placer lands in tracts not to exceed 160 acres, and that such tract shall conform to the system of public surveys. No provision is made for any reserved right in the Government, or for the disposition of the land subject to the rights of the placer claimant. The lode claimant gets a complete title to the lands within his patent, subject only to the express reservation which the law directs should be contained in the patent. No reason appears why a placer patent should not be construed in the same way, and the law has not expressed any limitation upon the estate, or authorized the officers of the Land Department to express in the patent any reservation. In the absence of a located lode within the limits of the placer claim, and of a contest, it would seem that the officers of the Land Department need only ascertain that there is a placer which may be entered as such.

The law of 1872 supplied an apparent defect in the law of 1866, as amended in 1870, by providing for a reservation of known lodes. This is calculated to protect the Government and to prevent the entry of lodes as placer, and thereby get lode claims for \$2.50 per acre.

The argument merely tends to show that the rights of the Government were not sufficiently protected by the laws of 1870, and the further provision made in 1872 in that matter seems to show that, in the opinion of Congress, without the express reservation, full title to the land would pass under the patent.

Deep Diamond Drilling at Johannesburg, S. A.

The deepest bore hole yet put down on the Rand at Johannesburg, Transvaal, S. A., is on the Turf Club ground, and was sunk by the Chester Diamond Drilling Co., using a Sullivan drill specially made for the service by the Sullivan Machinery Co. of Chicago, Ill. The illustration shows this drill in operation.

The hole was started in January, 1899, but stopped October 1 of the same year, owing to the imminence

of the war. The rods remained in the drill hole for twenty months while the war was going on. Their removal, on resuming work in May, 1901, was accomplished without any difficulty after the surface works were repaired. In starting up at this time, the full pressure of steam was applied at once. The rods took the strain and gradually and evenly slipped outwards, and continued to lift without a hitch until the entire length of nearly 2500 feet was removed.

This bore hole is the deepest hole put down. The Rand Victoria bore hole held the record on the Rand until exceeded by the Bezuidenville hole. The Rand Victoria bore hole struck the reef at 2400 feet, and about eight months was taken in performing the operation. The Bezuidenville bore hole was finished in December, 1895, and was the deepest at that date, the reef being struck at 3251 feet. The drill on the Turf Club ground is nearly 2 miles from the outcrop of the main reef. The Rand formation was cut within 25 feet of the depth at which it was expected to be struck, viz., 4800 feet.

The weight of the rods which did the boring was about sixteen tons. To prevent such enormous weight pressing too heavily on the carbons while drilling, the rods were suspended on a hydraulic cylinder, which allowed the rods to descend as desired; in fact, the weight of the rods could have been run at a pressure just sufficient to be felt, if necessary. The hole was sunk in 10½ months from the time the drill was put on the ground, inclusive of stoppages, but exclusive of the time the drill was hung up owing to the war.

The Commercial Production of Oxygen.

With the development of improved processes for the production of oxygen, the possibility of extending its uses in the arts naturally appears, and from a paper recently presented by the well known scientist, M. Raoul Pictet, before the Societe des Ingenieurs Civils de France, and published in the Memoires of the Societe, describes a method of obtaining oxygen cheaply from the air. He employs liquid air, basing the process on the difference in the boiling point of oxygen and nitrogen. Oxygen boils under atmospheric pressure at -183° C., and nitrogen at -195° C. The nitrogen thus vaporizes first. Unlike the Linde process, or some of its modifications, the Pictet process requires but an original charge of liquid air, and constantly renews this by the action of his process of procuring pure oxygen.

In the change of state from the liquid to the gaseous, the nitrogen and oxygen of which the liquid air is mainly composed, absorb heat from their surroundings. If these surroundings can be made to consist almost entirely of atmospheric air, this air jacket will be reduced in temperature, losing as much heat as is required for the vaporism of the original volume of liquid air. All that would then be necessary is a compressor to reduce the cooled air to the liquid state.

This, then, is the principle of Pictet's new process for the production of liquid oxygen. An initial mass of liquid is boiled by the heat delivered to it by a current of atmospheric air, the air first passing through a spiral pipe coiled around the reservoir containing the liquid air, and then through a second spiral immersed in the liquid. The liquid air slowly evaporates, the pure nitrogen first coming off, followed, as the temperature rises, by mixed nitrogen and oxygen, until finally pure oxygen comes off. In the meantime, the air which has passed through the spiral pipes has been lowered in temperature to the critical point, and requires but a feeble pressure to reduce it to the liquid state, and this pressure being supplied by a pump, there is obtained a supply of liquid air equal in volume to that with which the operation was started.

This can be repeated indefinitely, and as the apparatus can be readily arranged so as to render the operation continuous, we have as the only energy expended to produce the distilled gases that required to drive the compressing pump. Thus the quantity of liquid air which is evaporated each instant is replaced by an equal quantity, and no new supply is necessary.

It will be seen how at once this renders cheap oxygen a possibility. M. Pictet gives in his paper the elements of cost, and shows that oxygen 90% pure can be produced in commercial quantities at a cost of only 0.013 franc per cubic meter (\$0.07 per 1000 cubic feet).

If the air used in his process be mixed with carbonic acid, readily obtained from the waste furnace gases, a large quantity of solidified carbonic acid is produced as a by-product, and its sale is sufficient to defray all the cost of producing the oxygen, which is itself thus made the by-product. In the working apparatus the evaporated gases are collected in three holders, one containing pure nitrogen, the second for the mixed gases, containing about 50% of oxygen, and the third for the oxygen, about 90% to 95% pure.

The operation of the apparatus was shown to the Societe in complete working order, and in his paper M. Pictet gives the detailed thermodynamic computations of the heat interchanges, showing the full accordance of the process with theory.

The possession of cheap oxygen means a complete

revolution in many technical processes, and M. Pictet details a few of its applications; while many others will surely be developed.

In connection with metallurgy many applications are suggested. Injected into furnaces it will produce the complete combustion of carbon, with intense localization of heat, if so desired. Used in connection with the vapor of water, it gives the most powerful reducing agents known, i. e., carbon monoxide and pure hydrogen, thus enabling the removal of all the injurious metalloids commonly associated with iron, such as phosphorus, sulphur, arsenic, etc.

In connection with forge work, the use of oxygen would permit an enormous saving of heat, due to the absence of the diluting nitrogen of the atmosphere, enabling temperatures of 2200° C. to 2400° C. to be quickly attained. The use of the oxyhydrogen blow-pipe becomes a commercial possibility for large work and welded seams and joints for structural work may in many cases replace riveting.

The well known reputation of M. Pictet as a careful and conservative scientist, and the high standing of the body before which his demonstrations were made, render the paper one of especial weight and importance, demanding instant attention.

Telephone Systems in Private Houses.

The private house of to-day, instead of being equipped with a speaking tube, as was the custom a few years ago, generally has a modern telephone system connecting the various departments with each other. The main advantage of the telephone

over the speaking tube is that one outlet or one phone can be used to communicate to all of the different stations, whereas when the speaking tube was used a separate mouthpiece was needed for each and every station. In locating these outlets for the telephone great care should be taken in placing them where they will be most convenient for the use of the household, and also where they will not interfere with the fittings of the house which are to be installed at a later date, such as radiators, sideboards, etc. A very convenient place is near the casing of the door, as it is almost impossible to place any heavy article of furniture near a door. Caution should be used in first discovering which way the door is to swing.

The wire cable which is used in connecting the various stations should run as far from the water pipes as possible, on account of breaks in the pipes which are liable to occur, and the moisture from which would injure the wires, make cross-connection, cause leaks of current and soon destroy the vitality of the battery. A cable having a waterproof insulation is also protected against injury from rodents, which gnaw ordinary insulation, and frequently cause crossing or grounding of wires, which is difficult to locate and is very annoying both to the owner and the electrician.

Wall pockets or receptacles for holding the telephone are very useful at the outlets, for while keeping the telephones fully covered they do not deface the walls, and by their use many of the connections can be made inside and a buzzer or a bell can be placed within for the purpose of calling that station. The telephone itself can be very small and compact and by using the hand microtelephone in connection with a selective switch (see cut), an instrument having capacity of fifteen stations, will occupy a space of only 4 or 5 inches square.

There is no limit to the flexibility of a system of this description, as any station can call all the departments, or it can be so wired as to call only a certain few. By a simple attachment in the owner's chamber the telephone system can be instantly converted into an alarm system and all the bells be made to ring at one time by the simple pressure of a special lever. This can be used in case of fire, burglars or sickness, and is very valuable in suburban residences.

The illustrations show two simple instruments which are adapted for household purposes and are reasonable in cost. These and other patterns can be obtained from the Ericsson Telephone Co., No. 296

Broadway, New York City, who sell their telephones outright and subject to no rents or other charges. The Electric Railway & Manufacturers' Supply Co., 68-72 First St., San Francisco, Cal., are Pacific coast agents.

An Idaho Electrical Installation.

Coal costing \$17.50 per ton laid down caused the Trade Dollar Con. M. Co., Silver City, Idaho, to recently obtain other sources of power. At Swan Falls, on the Snake river, affording available water supply, a masonry dam was built 450 feet long, 9 feet wide below the river bed, 5 feet wide above, affording a working head of 19 feet and furnishing power suffi-

Trade Dollar Con. M. Co.'s Electric Plant, Silver City, Idaho.

cient for three belt-driven Westinghouse generators operated by four vertical shaft 72-inch McCormick turbines developing 3000 H. P. The current from the generators is at 500 volts, and is raised by the transformer to 22,000 volts. The main three-phase transmission line is 27 miles in length. The S. Morgan Smith Co. of York, Pa., furnished the water wheels and all the machinery except the electrical apparatus and the governor. The latter is run by electric motors and operates the gates of the four water wheels, it working in connection with a lever gate hoisting device which the makers say makes it possible to dispense with all gears which are used in ordinary practice. The vertical shaft turbines drive one horizontal shaft through beveled pinions, the horizontal line shaft being belted to three generators of 300 kilowatts each and to two exciters of 20 kilowatts each. The work was done under the direction of A. J. Wiley of Boise, Idaho, and has been working satisfactorily since its construction.

In the northern parts of Finland, Russia, rich deposits of ozokerite, or natural wax, have been discovered. These deposits lie along the bank of the Kemioki, not far from Tornea, and are remarkable for their large proportion of paraffine, besides 6% of various resinous substances. Hitherto ozokerite has mostly been found in the Caucasus, Galicia and America, and these new deposits are believed to have a great industrial importance.

The Grill Patented Compartment Ore Drier.

This device, which is here illustrated in view and transverse section, is intended for the drying of all kinds of ore in size from 1 inch diameter down to the finest slimes. The special feature is the division of the drier cylinder into four segmental portions, by

which the external surface is doubled and nearly four times as much surface is provided over which to spread the ore while drying. The material as it enters the drier is divided into four equal parts, so that it becomes thinly spread over a large area of surface.

As the material passes slowly through the drier it is elevated and cascaded through each compartment, coming out perfectly dry and at a temperature of 150° Fahrenheit. The manufacturers, C. O. Bartlett & Co., of Cleveland, Ohio, say that the furnace is so constructed that the combustion of the fuel is complete, and its fuel heat utilized. When used to dry ores, concentrates and rock minerals the heated gases of the fire are passed through them, after ap-

plying the heat externally around the drying compartments. In drying coal or substances in which there is danger of combustion the heated gases are applied externally only. Where the material dried is very fine and light there is a settling chamber either on the top or on one side of the drier, through which all the vapors are drawn and any fine material which they contain settled.

With this drier the manufacturers claim that one pound of bituminous coal will evaporate from eight to fifteen pounds of water, so 125 tons of coal carrying from 8% to 15% of moisture, or 200 tons of concentrates carrying from 8% to 10% of moisture can be dried in twenty-four hours with one of these driers 48 inches in diameter by 28 feet long.

END VIEW.

The Grill Patented Compartment Ore Drier.

Possibilities and Limitations of Electric Pumping.*

NUMBER II.

By LEWIS A. HICKS, C. E.

August J. Bowie, Jr., has since reported on the same problem, and under changed conditions as to cost of materials, recommends separate electric motors with a double reduction of speed through belt and gears to the crosshead operating stock pump now in use, and provided with a steam generating reserve in case of accidents, resulting in even temporary shut down of the water-generated current; this precaution being necessary, because the cutting off of the drinking water supply from large herds of valuable cattle during the intense summer heat results in serious loss. The operation of the pumps is to be controlled from floats in the water troughs, and the entire plan has been developed with much ingenuity to make available the existing pumps and wells. The resulting operating expenses would be about the same as for the pneumatic system, the saving effected in either case being sufficient to reimburse the owners for the entire investment within four years. The combined efficiencies possible of attainment in such installations would appear ridiculously small, but that power applications can be made with great financial advantage in many locations ordinarily considered outside the proper field for such work, is well illustrated by the case in point.

DEEP WELL PUMPS.—A satisfactory head for deep-well pumps is a much sought for device and attempts to meet the want may be found in a dozen different designs, involving special arrangements of gears or cams, to translate rotary into reciprocating motion suitable for single and double acting deep-well and cylinder pumps. Electric applications have been made to all of these types, and the possibilities of even so insignificant an amount as 3000 gallons per hour for irrigation of fruit and vegetables need to be seen to be appreciated. Good economy can be secured by using such pumps properly set and connected, even on a very small scale.

PUMPING FOR IRRIGATION.—The statistics of the development of subterranean waters in this State during the past three years by means of pumps shows a most remarkable growth, which has been fostered largely by the contemporaneous electric developments from the water power of the Sierras. In the southern part of the State the high prices of citrus lands and prevailing scarcity of water has accustomed people to paying for it at rates only possible because of the great value of the products raised. Four cents per inch per hour appears to be less than an average charge and ten and twelve cents is not unusual. Under these circumstances, there is not the same stimulus to obtain high efficiency that exists where water is cheap.

Where water is 70 or 80 feet below the surface and pit pumps are used, attendants, if not properly trained, are apt to permit the whole place to become dirty and greasy, and, when this is so, it is safe to say that the oiling devices are imperfect, shafting is out of line, boxes are hot, trouble is more or less continuous and much power is being wasted against hard packing and other useless friction loss. In contrast, the air lift, with nothing accessible underground, shines as a model of convenience for the attendants, and in the minds of some of the irrigators with whom the writer has talked this consideration seemed to outweigh the loss incidental to the use of single stage air compression with plant efficiencies of 20% to 25%.

When, as in southern California, crops are entirely dependent on artificial water supply and are immensely valuable, the attention of the land owner is fixed on the possession of water at any cost, and the unit price becomes a matter of minor importance in the aggregate returns. Steam, gas and crude oil engines, in a variety of designs, compete with electric motors in driving air compressors, deep-well pump heads and rotary pumps of the Root type. At the present time not less than 45,000,000 gallons per day are being pumped from the Gravel Cone of San Antonio canyon, in the vicinity of Pomona, with a lift approximating 75 feet.

The power conditions may be understood from consideration of what should be attained in any properly designed installation under such conditions. In a recent test made by the writer on about the same lift, a performance of 200,000 foot-gallons per kilowatt hour was secured. Allowing for friction in delivery pipes, this would mean 200,000-85x540=4.3 miner's inches per kilowatt hour, or a revenue of 17 cents per kilowatt hour of exerted energy.

At Riverside hundreds of acres of sidehill lands, formerly above irrigating supplies, have been brought under cultivation by pumps with lifts ranging as high as 100 feet, and throughout the southern part of the State well water development has more than offset the decreasing perennial supply.

In the San Joaquin valley conditions are much more rigorous, as the comparative abundance of gravity water and smaller crop values have fixed a

lower unit price for irrigating water. Lifts, as a rule, are not so high perhaps by half, but this does not commence to overcome the discrepancy in prevailing water rates, which are as low as 1 cent per inch per day, and probably average 3 cents per inch per day. Under the most favorable circumstances the cost of pumping may drop as low as 3 cents per inch per day, but to attain such economy is impossible in any other way than with cheap electric power.

The Lindsay Development Co., of Lindsay, irrigating 1800 acres of orange lands, has recently installed a 50 H. P. centrifugal plant manufactured under the writer's supervision, which, on the basis of a flat power rate, from the Mount Whitney Power Co., of \$50 per horse-power year and continuous operation, delivers water against a total lift of 69 feet for 3½ cents per inch per day.

This plant, consisting of a horizontal shaft centrifugal pump, direct coupled to 50 H. P. 2000-volt induction motor on common cast iron base, is set in a movable wooden frame, capable of being raised and lowered to follow the changes in the plane of saturation. Under test, it developed a combined plant efficiency of 64%, without allowances of any character, and a pump efficiency of 72%—the best record ever encountered in the writer's practice. The runner is of the enclosed type, with outside vanes to assist in minimizing side friction, vacuum parts near the nozzle tips, and practically no clearance in the shell. Readings from indicating watt meters on both legs of the two-phase current were checked by volt and ammeters, and again with time readings from an integrating polyphase watt meter. Gauges were tested and checked against each other at different elevations. The plant discharges into a 15-inch pipe line, which delivers water at different elevations to the individual stockholders. A gate valve is provided at the pump house on the main discharge, so that constant pressure and discharge can be maintained at any one of the discharge openings, or the flow may be by-passed to a weir and direct measurement made of the flow at any delivery point by regulating the pressure, as shown by gauge, to agree with the pressure indicated when actual delivery is being made. This plant shows an economy of 202,000 foot-gallons per kilowatt hour, and represents the best attainment of centrifugal pumps within the knowledge of the writer, and offers a cheerful contrast to the performance of an air compressor plant in southern California, working at the same lift driven by Corliss compound engines, burning oil under tubular boilers, with economizer, feed-water heater, surface-condenser and first-class equipment throughout, which realizes a comparative economy of 83,000-foot gallons per kilowatt hour.

There are exceptional plants, however, where the economy of the best centrifugal pumps is exceeded. The Hermosa plant of the Chase Nursery Co., at Riverside, Cal., realizes an economy of 215,000 foot-gallons per kilowatt hour, and consists of a 20 H. P. motor belted to a rotary pump, which takes water from a small gravity ditch and rises it 100 feet through 1300 feet of 8-inch pipe.

A centrifugal pump installed at the same point in competition only realized 133,000 foot-gallons per kilowatt hour. It frequently happens that the point of best efficiency of a centrifugal does not coincide with the conditions under which it is required to operate, and the case quoted of a constant water supply and lift is an illustration of the necessity of expert consideration in planning and installing such machinery, if economical results are to be attained.

At Exeter a pumping plant has been installed for the irrigation of a tract of orange land, requiring the delivery of water at a height of 500 feet. An induction motor belts to a countershaft, from which two vertical triplex single-acting pumps are driven.

A horizontal triplex, single-acting pump is also in use in the Kaweah district, belted in the same way, the plungers working in an oil bath in a closed shell. No exact data as to the economic performance of these pumps is available; but, from comparison with other pumps of the same type, it is probable that they are good for 200,000 foot-gallons per kilowatt hour.

Another type of irrigating pump consists of screw runners, mounted from 5 to 10 feet apart on a vertical shaft centered in the well casing, in which it is inserted by spring steel guides which carry babbitted bearings in which the shaft rotates. The weight of the water column and rotating parts is carried on a piston rotating with the shaft and subjected to static pressure, or upon ball bearings.

Accurate tests by the writer under exceptionally favorable conditions of this class of pumps show a performance of 88,000 foot-gallons per kilowatt hour when electrically driven, and this result was checked against indicator cards from a steam engine substituted for the motor, and showed substantial agreement.

In general, the performance of the several types, so far as they have fallen under the writer's observation, may be compared as follows:

| | Per Kilowatt Hour. |
|----------------------|----------------------------------|
| Air Lifts..... | 65,000 to 85,000 foot-gallons. |
| Propeller Pumps..... | 85,000 to 100,000 foot-gallons. |
| Deep Well Pumps..... | 100,000 to 175,000 foot-gallons. |
| Centrifugals..... | 125,000 to 200,000 foot-gallons. |
| Rotary Pressure..... | 210,000 to 215,000 foot-gallons. |
| Triplex..... | 200,000 to 225,000 foot-gallons. |

Each type has a useful place to which it is adapted, and the best results can only be secured by careful consideration of the conditions peculiar to each installation and an accurate comparative knowledge of the apparatus available for the purpose in hand.

OPERATION OF MINING PUMPS.—Owing to the conditions under which they are operated, mining pumps are notoriously inefficient, and the sinking pump as now used, actuated by air or steam, is extremely wasteful of power. The question of adapting electric power for sinking purposes came to my attention in connection with the unwatering of the Comstock mines after the introduction of the Truckee power. The available working room in the shaft compartment used for pumping is only 4 feet square, and this limitation, together with the distance between the levels 100 feet, made necessary a somewhat novel assembly of centrifugal pumps and electric motors, for which the writer worked up in detail as a matter of professional interest.

The quantity of water to be handled, 3000 gallons per minute, required at least a 10-inch pump, and clearances prevented the use of runner larger than 22 inches in diameter. The maximum lift of 120 feet required about 150 H. P., while the size of shaft would not admit anything larger than a 40 H. P. motor with vertical shaft. The speed of standard 40 H. P. motors gave an economical lift of about 70 feet, so that to attain the maximum lift would require two such pumps compounded.

(TO BE CONTINUED.)

Reopening of Pioche, Nev., Mines.*

[STAFF CORRESPONDENCE]

Pioche and its mining industry are reviving after a long period of inactivity. Old store buildings are being replaced by new ones, and painters are busy improving the general appearance. The mines being reopened are largely those in the Bristol district, 20 miles from Pioche, whose ores are found to run high in copper, which was overlooked in the operations of the '70s, when all efforts were directed to the recovery of silver and gold. It is now claimed the copper values left in the mines and on the dumps exceed per ton those recovered in gold and silver in the early days. As the result of sorting over various dumps within the last year or two, Freudenthal Bros., lessees, shipped copper ore of the value of \$60,000 to Salt Lake City, Utah, the ore running in car lots from 25% to 35% copper, with considerable values in silver.

Within the past few months at least twelve of the old shipping properties of the Bristol district have been grouped together and sold to the Bristol Copper M. Co. and Hillside M. Co., at the head of which is W. Gelder of Denver, Colo. These include the May Day and Hillside, which will be remembered by old-timers as among the important producers of the early days of the camp. Active development has been commenced by these companies on four of the properties, the May Day and Great Eastern having been equipped with plants of machinery, including electrical equipment for light and for power drills. On the May Day the old 500-foot incline has been straightened up, provided with track and 1½-ton skips, capable of hoisting fifty tons per hour. Development and work on the levels are to be carried forward with Gardner electric drills.

The old shaft on the Great Eastern has been straightened from the surface to the 200-foot level, from which point a new shaft has been sunk to a depth of 400 feet. Recent drifting on the 150-foot and 300-foot levels have exposed good bodies of high-grade ore. From the 300-foot level a connection has been made with the May Day workings; and similar connection is being made between the 400-foot level of the Great Eastern and the May Day. The breast of the latter work is said to be in a good grade of smelting ore. The two properties have a large tonnage of ore in the bins and on the dumps awaiting shipment. The workings of the old Hillside mine are being put in condition for work; and on the Oregon Short Line group a new shaft has been sunk into a body of ore carrying 50 to 100 ounces silver, 30% to 50% lead and 5% to 10% copper. A test carload of this, sent to Salt Lake City, Utah, ran 152 ounces silver, \$7.60 gold, 41% lead; another carload gave 68 ounces silver, 30% lead, 9.3% copper; still another car of selected copper ore ran 30%. This mine and the Hillside are on the same vein and a level is being run to connect the workings of the two.

Mr. Gelder and associates have leased the smelting plant at Pioche and the railroad from Pioche to Bristol camp. The latter is being ballasted and put in shape for new ties and track. The smelter is being remodeled and partially rebuilt under the direction of S. E. Bretherton. In addition to re-equipping and raising the two rectangular furnaces, a new furnace is being put in for resmelting the copper matte turned out by the other two. White-Howe revolving roasters have been put in. The ores of the Bristol district are of an oxide nature and the company is opening the Zero mine at Pioche, from which it is expected to obtain sulphide ores to mix with the oxides at the smelter. The same company has acquired the Bullion Bill group at Pioche, which is a producer of manganese ores, carrying gold, silver and lead. It is

* See illustrations front page.

*Submitted for discussion at the fifth annual convention of the Pacific Coast Electric Transmission Association, San Jose, Cal., June 18-19, 1901.

claimed that present workings show an ore body 200 feet wide, without encountering either wall. It is figured that these ores will supply all necessary fluxes of the kind required.

A company of New York people have bonded and leased the properties of the Pioche Consolidated, at Pioche, and have commenced development. They contemplate putting in a large pumping plant to unwater the various mines at Pioche. This enterprise has been promoted by E. F. Freudenthal of Pioche and A. T. Lewis of New York.

Pioche, Oct. 1.

Mining and Metallurgical Patents.

Patents Issued October 8, 1901.

Specialty Prepared for the MINING AND SCIENTIFIC PRESS

MINING MACHINE.—No. 684,356; H. B. Dierdorff, Columbus, Ohio.

Relatively elevated longitudinal bed bars, carrying longitudinal racks and adapted to provide a carriage guide, an engine or motor and gearing, a platform or carrier for motor and gearing arranged to hold them as described, whereby they are partly supported above and partly below horizontal plane of aforesaid guides and racks, a relatively lower guide-way at front end of bed, a chain support in horizontal planes of front guideway and having two or more longitudinal bars connected to transverse braces which cross central longitudinal vertical planes of machine, and arranged to move forward and back without impinging on front guide, a cutter chain held by support, a rear driving sprocket wheel forming part of gearing, and two front wheels for chain, the wheels being arranged to hold chain on one side on a line tangential to periphery of driving wheel and to periphery of one front wheel and to hold chain on other side of a line tangential to periphery of other front wheel, and to periphery of driving wheel.

MINING MACHINE.—No. 684,375; B. A. Legg, Canonsburg, Pa.

An endless chain provided with cutters arranged to rotate throughout in horizontal planes, wheels for chain at ends of its cut, a driving sprocket wheel situated between end wheels engaging directly with endless chain, one or more cross bars or plates supporting wheels, a sliding non-rotary carriage rigidly secured to and supporting cross bars, a bed or

holder for carriage, means for moving carriage forward and back, and means independent of carriage-moving devices for actuating cutter chain.

MACHINE FOR MAKING WOODEN WEDGES.—No. 683,918; M. Edel, Haverhill, Iowa.

A suitable bed having a recessed seat for block of wood from which wedges are to be cut, a bearing plate having guide flanges secured to bed, a slidable knife engaging with flanges, brackets secured to sides of bed, a bifurcated hand lever pivotally connected to brackets and pivotally connected to knife.

ELECTRIC FURNACE.—No. 684,296; W. Nernst, Göttingen, and L. Glaser, Coburg, Germany.

A working chamber constructed with a dry electrolyte to develop heat by agency of its resistance to electric current, conductors for supplying chambers with current and preheating means for exciting it, combination with chamber, conductors and preheating means of intermediary conductors composed of such metallic oxides as manifest some electrical conductivity at ordinary temperature and placed between chamber and supply conductors in intimate contact therewith.

IMPACT WATER WHEEL.—No. 684,045; F. H. Cook, Mead, Wash.

Parallel disks or heads, a series of fixed buckets between disks or heads, each bucket made U-shaped at one end and having its inner wall extending a considerable distance beyond free end of outer wall and a plate disposed approximately parallel with long inner wall of bucket and terminating within space between two walls forming U-shaped portion of bucket, long inner wall of bucket and guide plate forming an elongated channel for passage of motive fluid.

ORE SAMPLER.—No. 684,314; J. Scobey, Denver, Colo.

A bucket or device adapted to remove or divert a portion of material to be sampled as it is passed therethrough, a lever connected with the device, a wheel adapted to rotate continuously, a number of other wheels each provided with a number of slots, the rotary wheel having a projection adapted to successively engage slots of one of other wheels, which is thereby intermittently moved, and this intermittently moving wheel having a projection adapted in

turn, to engage successively slots of next wheel and impart an intermittent movement thereto and so on with any suitable number of slotted wheels, a gear mounted on last intermittently moving wheel of series, or one more remote in order of operation from rotary wheel, and provided with a tooth or cog, a yoke having an elongated opening in which gear is located, yoke having a tooth or cog on opposite sides of its opening, which is engaged by tooth or cog of gear as latter is actuated, whereby yoke is reciprocated, and a suitable connection between yoke and lever whereby latter is operated by former.

ROLLER MILL FOR CRUSHING AND GRINDING.—No. 684,148; J. C. Wegerif, London, England.

A roller rotating within and in surface contact with a revolving ring, axes of roller and ring being oblique to one another and in different planes, and acting external surface of roller and internal surface of ring being mutually of such relative configuration that a continuous line of bite between surfaces of roller and ring will be maintained notwithstanding their mutual axial obliquity, and a disruptive as well as a crushing action will be produced.

Getting Gold From Sand.

An appliance has been perfected in San Francisco for the reclamation of fine, flour-like and microscopic gold values contained in deposits of auriferous sands, as are found upon ocean beaches as well as in beds and upon the bars of rivers and streams. The process is the invention of F. M. Johnson of San Francisco and has been purchased by the Rose Gold Reclamation Co. for the purpose of operating it and placing it upon the market in this and foreign countries. They claim that the appliance is simple and inexpensive in construction and operation and does its work effectively, and that it is the application of a principle whose simplicity causes wonder that it was not long ago discovered and applied. They assert that it not only saves the gold, but the platinum as well, and does it at no greater cost than the ordinary expense involved in getting the sand and water into it.

The exterior of the invention shows a box of the ordinary sluicing pattern, built of 1-inch boards, 12 feet in length, 12 inches in width and 5 inches in depth. The interior (covered by patents applied for), designed to save the gold and platinum values, is a matter of arrangement rather than of material, the latter costing not to exceed \$1.50. Neither plates, mercury nor magnets are used. The owners state that two to three tons of sand per hour were run through one of these appliances day after day, consecutively, during a trial test of about thirty days upon the beach sands at Aptos, near Santa Cruz, Cal., and that all of the gold and platinum carried by the sands were reclaimed and saved, and that the gold saved in this test run averaged 400 colors of gold to the cent in value. They also state that in addition there have been numerous and exhaustive tests of sands from Nome, the Snake and Columbia rivers, of the beach sands upon the California, Oregon and Washington coasts, as well as those from the Colorado river.

They say that these boxes may be placed in batteries of five, ten, twenty or more, up to any number desired, and the sand and water may be put into them either by hand or with mechanical appliances, no further expense in operation being required, and that they may also be used as an adjunct to ordinary sluicing or hydraulic operations, with the result of saving the values in fine gold contained in the sand concentrates which are otherwise lost. The Rose Gold Reclamation Co. go on the proposition that the cost of putting the sand and water into these boxes (the latter often being made available by gravity) should not exceed 5 cents per cubic yard of sand in cases where the plant has a working capacity of 500 to 3000 cubic yards per day, and that deposits of auriferous sands carrying values in gold so low that they have been considered worthless may now be worked with satisfactory results. The field is practically limitless, not only in this country, but in others. The Nome district is of value, and there are many deposits upon the Alaska coast and farther south, in the vicinity of Vancouver, where large operations may be conducted. Upon the Washington, Oregon and California coasts are other deposits that are expected to yield handsome returns, while the Snake river and the Colorado fields are of considerable extent. The Rose Gold Reclamation Co. has opened general offices in the Claus Spreckels building, San Francisco, Cal.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Nowell Co. is working sixteen men on the Glacier lode, and running its 30-stamp mill and compressor plant. F. T. Hammond is superintendent.

The Boston Group G. M. Co., at Juneau, have increased the capital from \$100,000 to \$150,000, to buy adjacent property. J. Wagner has been appointed manager.

NOME.

Statistics carefully compiled indicate that 9000 persons went to Nome this season and that 10,200 have returned or are returning, leaving about 4000 in the district for the winter—less than spent last winter there. There were eighty vessels, steam and sail, engaged in the traffic, carrying in over 60,000 tons. About \$4,500,000 gold has been shipped from Nome this season.

KETCHIKAN.

The Big Three group, bonded from J. M. Smyth, J. Brennan and D. Nicholls, by J. Freeburn and S. Lichtenstadter, of Ketchikan, consists of five claims, about 12 miles due west from the head of Karta bay, on Prince of Wales island. A well defined 3-foot-wide vein is exposed for 1600 feet.

PORCUPINE.

C. Stewart and J. Roberts of Seattle have bought of A. Anderson bench claim No. 6 of Cahoun gulch. The buyers propose to put a large number of men at work on the property next spring.

ARIZONA.

CHOISE COUNTY.

At the Calumet & Arizona mine, near Bisbee, a strike of rich malachite and azurite ore has been made on the 850-foot level. I. L. Merrill is superintendent.

GILA COUNTY.

The Old Dominion Copper M. & S. Co. is experimenting with crude petroleum at the smelting works at Globe to ascertain the cost of generating steam as compared with coal and wood. The oil being used is the last of a lot brought in there in 1893, when owing to the high cost its use was found to be impracticable. The present test will cover a month's time.

MOHAVE COUNTY.

F. Mitchell has made a carload shipment of 700-ounce silver ore from the Century mine at Chloride.

J. M. Murphy, of Kingman, is superintending the unwinding of the old shaft of the Payroll mine at Chloride preparatory to sinking it deeper and reopening the old levels.

PIMA COUNTY.

The Magnetic nickel mine near Tucson, owned by H. Melluish, is to be developed on a considerable scale.

CALIFORNIA.

AMADOR COUNTY.

At the Peerless mine, near Jackson, the crosscut west from the shaft on the 800-foot level is advanced 150 feet, and from 30 to 50 feet more is expected to develop the ledge.

Dooley Bros. have struck a seam in the quartz ledge owned by them near Ranlett, from which they took out over \$800 in a few hours.

BUTTE COUNTY.

Thirty men are employed on new buildings under construction for the Bay Counties Power Co., at French Creek, above Oroville. The dam in French Creek will be 120 feet high, 700 feet long on top and 70 feet at the bottom. A 6-mile long ditch is to be made to carry water from the reservoir to the power house. A new road 6 or 8 miles long will be made to haul machinery from Berry creek to the power house. Operations will soon be suspended until next spring.

CALAVERAS COUNTY.

P. Lancelle of Mokelumne Hill, in six days' work with a pan in a newly discovered channel of auriferous gravel in his claim, has taken out \$208 in heavy nuggets.

EL DORADO COUNTY.

The buildings at the Zantgraf mine, near Auburn, were totally destroyed by fire on the 14th inst. The fire started in the mill, and the hoist and a portion of the shaft were burned. The miners escaped through a tunnel at the 300-foot level. The loss will reach \$30,000 or \$40,000. The mine had only been started up a few days under new owners.

LAKE COUNTY.

The Sulphur Banks and the Abbott Quicksilver, in this county, and the Empire and Central, in Colusa county, com-

prising 3884 acres of land, have been bought by Eastern people for, it is reported, \$1,000,000, from R. A. Rodgers and W. Corbin of San Francisco and their associates. From the first two named properties it is said that \$2,000,000 in quicksilver was formerly taken out, but the Empire and the Central are only partly developed. The buyers are incorporated as the Empire Con. Q. M. Co. of New Jersey. The president is W. H. Dowe of New York. The present daily capacity of production is 175 tons of ore; but the new owners contemplate increasing this to 225 tons daily by the construction of new furnaces and further development, making the monthly product of quicksilver about \$140,000.

MONO COUNTY.

H. W. Nelson, Supt. of the Goleta M. Co.'s mine at Jordan, reports that the company has decided to resume work upon it. The Copper Mountain mine has been worked for a number of years and has a 40-stamp mill. The ledge is over 100 feet wide and carries some values clear across. Thirty-five feet of it, he says, carry about \$10 a ton.

NEVADA COUNTY.

Operations at the Grizzly Hill mine, near Nevada City, it is reported, will be commenced about the first of November. Supt. Hall has installed a water-wheel plant to operate the machinery.

The Sunflower mine, near Rough and Ready, is being worked by a Sacramento company. H. H. Look of Sacramento is president. They are installing a new 5-stamp mill, a hoist and other machinery. Twenty men are employed. Several shafts have been sunk on the mine, which it is said have developed good ore from the grass roots down.

Work at the Jupiter mine, at Iowa Hill, is going ahead steadily. Gravel is being breasted and the main gangway is being extended. Twelve men are employed. H. F. Calenberg is superintendent.

A new mill is to be erected immediately at the Home mine, at Grass Valley. W. C. Body of Grass Valley has the contract, and ten stamps will be added to the present twenty.

C. A. Giffin of Los Angeles has bought for Los Angeles people, in the Meadow Lake mining district, an interest in the mill and mine of L. D. Butts, J. M. Giffin and others. A new shaft will be sunk at once. Some new machinery will be put in and a large force of workmen put on.

At the last meeting of the Debris Commissioners held in San Francisco an application was made by G. C. Sargent of Dutch Flat for permission to work his claim by the hydraulic process. His plan for impounding the debris from the mine has been approved.

The Gold Crown Con. M. Co. at Omega is having the new shaft sunk rapidly. The mine is run by a steam hoist, and it is expected shortly to erect a mill.

PLUMAS COUNTY.

(Special Correspondence).—The Bushman placer mine, the property of C. D. Hazard, is sold, through G. T. Rives, to H. Epstein and others of San Francisco. The property is 5 miles from Quincy and has been a great producer.

Quincy, Oct. 14.
J. Spurgeon and V. Allen, formerly of Chico, but lately from Klondike, have bonded the Swiss drift mine near Prattville from B. Piazzoni, with an agreement to put in machinery and develop the property to the extent of \$15,000, for a half interest.

SACRAMENTO COUNTY.

W. P. Bonbright, H. G. Lunt and F. E. Brooks of Colorado Springs, Colo., have incorporated the Colorado-Philadelphia Gold Dredging Co., office at Colorado Springs, to operate the mines of the Pacific Gold Dredging Co., on the American river, near Folsom. The old company has had a dredger at work for a year with excellent results, and the new corporation has been organized to buy and put into operation immediately a new dredger with a capacity of 3000 cubic yards a day. The company's property consists of about 200 acres, and it is likely that additional acreage will be bought.

SAN LUIS OBISPO COUNTY.

The Oceanic Quicksilver Co., composed of Los Angeles people, has completed the construction of its 60-ton roasting plant and has begun operations. The mine is 7 miles from Cambria.

SHASTA COUNTY.

A crew of six dredger builders are at Redding from Port Huron, Mich., for the purpose, it is reported, of building a large dredger in the Sacramento river at Middle Creek, to mine for the gold carried down the creek into the river. The bottom, it is reported, prospects well.

The Mammoth copper mine, near Redding, has been sold by the bonders, J. Filius and F. G. King, to the Boston Exp. Co. of Boston, Mass., for, it is said, \$250,000, on a six months' option. The company, it is stated, will put a large force of men on the mine with the intention of building a smelter.

The Alta gold mine has been sold by Mrs. J. Wilson to F. Gates. The mine is near Furnaceville, about 35 miles east of Redding. At the time of its discovery, about two years ago, several thousand dollars was taken from a "pocket" near the surface.

Shasta county will be represented in the State Miners' Association in San Francisco, Cal., by 100 representative mining men. The Northern California Miners' Association has been organized at Redding. C. C. Bush is president and F. Hurst vice-president. The association will include several counties.

The Summit group of copper claims in Backbone district, near Redding, has been bonded to F. E. Ware of the Mount Shasta G. M. Co., who is believed to represent Chicago people in the matter. The owners of the Summit group are M. E. Dittmar, G. Graves and W. Avery. The second option is on twelve claims owned by R. M. Sealtzer and J. Smithson.

The Bully Hill smelter at Salee is smelting at the rate of 150 tons of ore daily. The amount of Bessemer copper produced, in the form of plates or ingots, has averaged 350 tons per month since June 1. The rate is now increased to 400 tons a month. The company is making a shipment of 1600 tons.

H. H. Thompson of Old Diggings district and J. Barber are working the north portion of the Reid mine under lease. D. McCarthy of Keswick has a bond on the south portion of the property and is working.

SIERRA COUNTY.

The work of installing machinery at Rock Creek mine, at City of Six, near Downieville, has been completed and sinking resumed in the shaft.

SISKIYOU COUNTY.

J. O. Welsh of Mott has sold his placer mines at French creek, in Scott valley, to an Eastern company.

The Sheba mine, at Patterson creek, is now being worked by the Patterson Creek M. Co. A shaft is being sunk for development before taking out ore to crush. This mine is equipped with mill and hoisting machinery.

TUOLUMNE COUNTY.

By the closing down of mines owing to the shortage in water supply about 500 men in Tuolumne county have been thrown out of employment.

It is reported that the Lamphere mine, near Confidence, will be started up again soon.

The Hellsgate mine, located on the main Tuolumne river about 6 miles south of Carters, has been sold to V. Gianella.

The Starr King and Sherman mines, near Carters, have been sold to H. W. Jackson and F. H. Newton by the Sherman M. Co.

At the Hard Tack mine, on Hunter canyon, the vein is reported 3 feet wide and very rich in free gold.

The rich ore discovered in the Starr King mine is found in an 8-inch ledge on the 375-foot level, where the vein changed from white quartz to ribbon rock.

Practically all the mills in the county relying on water or electricity for power have been closed. The water supply held out for a longer period this year than for any previous year in the past ten years. Heretofore the supply would fail in August and sometimes in July. The improved condition and increased capacity of the water company's system of dams and reservoirs have made the supply this year hold out longer.

The Mohican mine, at Sonora, is showing ore of good value. The 5-stamp mill will soon be ready for service.

The \$37,000 pocket recently found in the Tany mine, at Sonora, was taken out in less than one day—one-third of all the material removed to get it being the gold.

YUBA COUNTY.

Supt. Haskell, of the Miller mine, near Forbestown, is building a 20-stamp mill for the mine. At present a drain tunnel is being run to tap the ledge 185 feet from the surface, near the bottom of the shaft, which is 200 feet down.

COLORADO.

ARAPAHOE COUNTY.

S. Newhouse is in Denver, figuring on the establishment of a new custom smelter, independent of the American S. & R. Co., and states that he will build an independent smelter in Utah, to handle ore from his own mines.

CHAFFEE COUNTY.

An independent smelter is projected to be constructed at Salida to treat the ores of mines not now shipping to the American S. & R. Co. The Ohio S. & R. Co. has been incorporated, capital \$3,000,000, with office in Denver. The directors are J. C. Kortz, T. Goodman, J. M. Thomas,

H. G. Redington and G. A. Steinbenner, who own the New Monarch mine at Leadville, which they claim they have not been able to work through the refusal of the smelting company to treat their ores.

CLEAR CREEK COUNTY.

(Special Correspondence).—The town of Empire is 1½ miles from Empire station, on the Colorado & Southern Railroad. It is situated near the north fork of Clear creek, at the foot of Cavode mountain, on the road to Berthoud pass, beyond which is Middle park. Near the head of a gulch, 1½ miles north of Empire, on Silver and Cavode mountains, are four important mines. They are the Gold Fissure, Silver Mountain, Gold Dirt and Conqueror. The first named is a new mine and is shipping twenty to twenty-five tons of ore daily to the Silver Mountain concentrator. The ore body is opened by a 95-foot crosscut from the 300-foot shaft.

The Conqueror was extensively worked thirty years ago for placer gold. It is now being further developed as a lode mine by E. F. Welles and associates. A winze sinks 100 feet at a point in a tunnel 400 feet from the entrance. At the bottom of this a 200-foot crosscut is being run to cut the vein, which is worked out at the higher levels. The ore values are principally in gold. An old mill on the property will be re-equipped as a concentrator.

The Gold Dirt mine and mill belong to the Empress M. Co. This is also one of the newly made old mines of the camp. It has a 550-foot shaft on the vein, with extensive drifting in both directions from it. Crosscuts have also been run to cut other veins. They hoist about thirty tons per day, nearly all of which is milled at the company's concentrator. The ores are an iron and copper sulphide, with gold values. The Tenth Legion mine is on the same belt.

The Silver Mountain mine has been closed down temporarily, but is expected to resume work soon. The concentrating mill which belongs to this property is located at the railroad, and is operating on Gold Fissure ore.

L. E. Davis has a group of fourteen claims on Eureka mountain, near town, which is said to cover a number of veins which have a northeast and southwest trend. He has done about 600 feet of tunnel work on one claim and developed good values in gold and silver, with some copper.

The Woodbury M. & M. Co. is doing considerable development on several mines in the district and have bought the old Atlantic mill, which will be put in condition to operate. R. S. Grier is manager.

The Empire Tunnel Co., of which E. A. Maxwell, F. P. Dewey and C. Jarbeau are manager, treasurer and secretary, respectively, with offices at Georgetown, has commenced operations at the foot of Cavode mountain. The tunnel, now in 560 feet, takes a northerly course through the latter mountain, the plan being to drive 10,000 feet, cutting 1600 feet below the surface. It crosscuts the known veins of that locality. The company have seventy claims located on the tunnel's course. At the entrance is a Leyner compressor plant, operated by a 6-foot water wheel, the latter driven by 95 feet head of water conveyed 2400 feet through a 2-foot pipe line.

WASCOTT.

Empire, Oct. 10.

(Special Correspondence).—The Kokomo-Pioneer M. & M. Co. are preparing to operate the Pioneer and Milton on Mill Creek gulch and the Kokomo, near Russell gulch. The first group is opened by tunnels and shaft, there being ore on two different veins. The Kokomo has a 300-foot shaft, considerable drifting, and has a steam hoist. The company's mill at Dumont, having thirty stamps, four Cammett tables, six Frue vanners and two gasoline engines, is being put in condition to start up this month in charge of Wm. Boardman. This mill may be run by water power part of the time, as it is equipped for it. They expect to make two grades of concentrates. E. H. Wilson is general manager of the company.

Dumont, Oct. 12.

GUNNISON COUNTY.

The 100-ton smelter building at White Pine is nearly complete. The Southwestern Smelting Co., composed of Denver and Chicago people, is putting it up. The plant is designed for low-grade ores, and is expected to blow in about November 1.

LAKE COUNTY.

While Leadville produced over 68,000 tons of all classes of ore in September, this tonnage could be considerably increased were the smelters in a position to handle the ore. In many cases shipments have been curtailed to half what could be handled were the smelters taking the ore.

The new shaft being sunk by H. I. Higgins on the Homer placer, at Leadville, is down 150 feet. It is experimental work on entirely virgin ground. Mr. Higgins

believes that the porphyry will be caught at about 250 feet and then a diamond drill will be put in to find an ore body before sinking the shaft deeper. The Homer placer is owned by the Leadville Tunnel and Drainage Co.

Work on the Twin Lake placer, which is being operated by the Arlington Syndicate of London, is under the management of N. A. Loggin. The estimated value of bullion produced in May was \$10,000, in June \$11,000, and the product of the year is expected to be \$75,000.

PUEBLO COUNTY.

The city of Pueblo proposes to enjoin the owners of the placer mines at Granite to prevent them from emptying their tailings into the Arkansas river. F. O. Harvey is the Supt. of the company which is putting the hydraulic tailings into the river. The mayor and city attorney were authorized to take immediate steps for the enjoining of the mining.

SAN JUAN COUNTY.

The strike recently made on the Ruby Trust mine, on Mineral creek, near Silverton, continues to improve. The ore body shows from 6 inches to 3 feet in width, and contains brittle silver, sylvanite, steel galena and copper sulphides.

TELLER COUNTY.

An old shaft on the Martha Washington claim, belonging to the Independence group on Battle mountain, at Cripple Creek, has been leased to C. Lambert and J. Sharp. The shaft is said to be the one at which W. S. Stratton made his original discovery of ore on Battle mountain. The shaft is down 80 feet but the lessees are understood to have the privilege of sinking it to 400 feet. They will install a steam hoist and begin active developments.

IDAHO.

BLAINE COUNTY.

A strike is reported at the Jumbo mine, near the bottom of the 80-foot winze, sunk from the lowest tunnel. The discovery is believed to indicate the downward continuity of the ore body mined above. The mine is near Halley.

BOISE COUNTY.

Returns from a carload shipment of ore from the Gold Eagle mine, near Neal, W. D. Southworth, manager, gave an average return of \$80 per ton. The ledge is large, and it is said one-fourth of it is shipping ore. The mill on the mine is run on mill grades of ore.

KOOTENAI COUNTY.

J. A. Evans of Pend d'Oreille has sold eighteen tons of dry silver ore for \$6000 net after paying freight and treatment charges. The ore came from the B. F. & H. mine, on Black Tail mountain, near Lake Pend d'Oreille. Mr. Evans is the sole owner of the mine and works it during the summer months with two or three men. The last shipment went 590.5 ounces in silver and 3.6% in copper. A shipment of sixteen tons made in April netted \$3280. The mine has been developed by about 400 feet of tunneling, and the ledge runs from 2 inches to 2 feet in width.

OWYHEE COUNTY.

L. Sorenson and G. Lewis have made a crushing of nineteen tons of ore from the Never Sweat mine at Silver City which yielded \$200 per ton. Sorenson & Lewis are preparing to put on fifteen men.

Grete Bros. have begun work on the San Juan mine, near Silver City. The shaft now being cleaned out and repaired was sunk more than twenty years ago and a considerable amount of high-grade ore was taken out of it.

LOUISIANA.

CALCACU.

An oil well, 3 miles from Welsh, that was capped, had the cap blown off and thrown 100 feet from the well. Rocks, water gas and oil were thrown 250 feet in the air, and for a lateral distance of a quarter of a mile. The top of the derrick was completely torn off. The well is now 200 feet deep.

MICHIGAN.

HOUGHTON COUNTY.

At the Champion mill site at Houghton the company is finishing the excavation. Foundations are completed. The mill walls will be constructed of concrete, gravel being taken from the shore of the lake, 2000 feet from the mill site, and conveyed to it by an inclined tramway. The pump will be 8 feet below the level of the lake, and the intake will probably be through a tunnel under the lake bottom.

The Calumet & Hecla Co. has drawn the pumps from shafts 16 and 17 on the amygdaloid lode. This, it is said, means the practical abandonment of this portion of the mine for a long time to come. The shafts are filling with water and only one shift is working in the amygdaloid part of the mine.

MONTANA.

CHOTEAU COUNTY.

J. Torkelson of Landusky, brings several hundred dollars in gold, the free-milling product of the first run of The Mission Peak M. Co.'s new 10-stamp mill at Landusky, which has been started up and run as a concentrator; it operates satisfactorily. The ore, it is claimed, runs about \$14 per ton, partly free milling, but most of the value going into concentrates and tailings, that will be treated by the cyanide process when that section of the mill is completed.

FERGUS COUNTY.

Ore has been struck in the "D" level in the mines of the New Year G. M. Co. at Madison. J. Meredith is superintendent. The tramway is nearly completed and the mill is expected to be started this fall.

JEFFERSON COUNTY.

The Sailor's Dream mine, 14 miles northeast of Butte, is owned by P. Kendrick and A. Boston, who located it about thirteen years ago. There are two veins, one 8 and the other 12 feet wide, and the ore averages about \$8 per ton. There are rich shoots in each vein, the ore of which is shipped to smelters. Other ore that averages \$20 is crushed in a Hendy 2-stamp mill on the mine. Kendrick & Boston do all of the work, first mining out a lot of fifty or sixty tons of ore, which they mill, stopping the mine till they have cleaned up and sold the bullion.

LEWIS AND CLARKE COUNTY.

G. Seiple and associates are working the Copper Queen and Copper King claims near Helena. At the bottom of a 50-foot shaft the ledge is from 6 to 11 feet wide, with a pay streak from 4 to 12 inches wide.

MADISON COUNTY.

The Mountain Chief & Blackwell Co. has suspended operations in the Homestake district. The company was running a 10-stamp mill on ore from its mine, but, it is claimed, could not save sufficient values to pay.

SILVER BOW COUNTY.

S. P. Alexander and R. R. Moore are proposing to save all of the copper values of the tailings from the various smelters in Butte. They claim that they can save all the copper in tailings that assay as low as 1% and make a profit, or can take copper ore, assaying as low as 1½% or 2%, crush it, then treat it by their process and make a good profit. The process they have employs reagents in leaching which are recoverable.

NEVADA.

WASHOE COUNTY.

On the Cabin claim of W. C. Williams at Olinghouse an area of two acres of surface averaging 2 feet deep is being plowed and the decomposed quartz shoveled into sacks and milled, averaging about \$25 a ton. It is estimated that there is \$80,000 on the surface in sight. The gold is coarse, mostly the size of a pin head, and from that to a pea.

In the Reno Star mine thirty tons of ore is taken from the 100-foot level by each shift. The estimated value of this output is \$2800.

NEW MEXICO.

COLFAX COUNTY.

The Ora Dredge Co. at Elizabethtown has completed its dredger and begun operations. The first cleanup from a two weeks' run is said to have amounted to several thousand dollars. The second and third are also said to have paid well.

GRANT COUNTY.

The Log Cabin mine, near Santa Rita, has been sold to J. Ritter of Pueblo, Colo., who has put men on beginning development.

W. H. Newcomb has bonded the Southwestern Copper Co.'s mine in the Burro mountains at, it is said, \$400,000.

The Clifton Copper Co.'s 100-ton mill at Santa Rita, operating on ore from the Wild Cat mine, has started up. J. L. Burnside is manager, J. Hodge mine foreman and C. H. Wilkie mill foreman. The machinery in the mill consists of two Huntington, one crusher, one roll, two Wilfley concentrating tables and two Standard concentrators.

TAOS COUNTY.

The Red River Copper Co. at Red River has installed a new diamond drill and other machinery and begun operations on the Anaconda copper mine at Red River City. The diamond drill will be used to locate veins which are supposed to exist on the company's properties.

OREGON.

BAKER COUNTY.

E. D. Tobin, manager, of Chicago, who is developing a mine near Bonanza for the Olive Creek M. Co., reports the cutting of

a 34-foot ledge of \$20 ore in the lower tunnel at a depth of 400 feet.

J. W. Carr, manager of the Oregon-Colorado M. & M. Co., which owns the Quebec mine, near Alamo, reports the 20-stamp mill at the mine as operating, and that the company is now considering the changing of the power at the mill from steam to water, for which purpose the company has bought water rights.

F. P. Hayes, of Philadelphia, Pa., managing owner of the Bonanza mine, which he bought last year from the Geizers for \$750,000, has bonded 60% of the stock of the mines to F. Moore, P. N. French, J. M. Patterson and E. A. Frenzel of Pittsburgh, Pa., on the basis of \$2,000,000 for the entire property. Deep shaft sinking is to commence at once.

JOSEPHINE COUNTY.

The McKay mine is situated at an altitude of from 4300 to 5100 feet, in the Siskiyou mountains, the boundary line of Oregon and California running through it. It was discovered three years ago and is now owned by W. H. Hamilton, S. H. McVey, L. F. Cooper and B. G. Adams of Crescent City, Del Norte county, Cal. It is located at the head of Joe creek, a tributary of Elliott creek. During the past summer a large lense of sulphide ore was uncovered at this mine.

Morris & Hosler have sold their half interest in the Powell Creek placer mine, near Grants Pass, to I. N. Haley of Philadelphia. Sharpe Bros. retain their interest. The mine will be worked on an extensive scale this season.

LANE COUNTY.

P. J. Jennings, president of the Helena M. Co. and the Musick M. & M. Co., located in the Bohemia mining district, announces that a railroad will be built from Cottage Grove, a distance of 35 miles through a region of heavy timber to the Bohemia mines. It is expected that construction work will begin this fall. Connected with this is the project of building a smelter, either at Portland or in the Bohemia mining district.

WALLOWA COUNTY.

Copper has been discovered in the most inaccessible mountains near the headwaters of the Imnaha river, near Cornucopia, Union county, by A. Neal. He says he has found a copper-bearing ledge 100 feet wide between well-defined walls.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The shaft on the Holy Terror Co.'s mine at Deadwood is down about 1200 feet. It is stated that the vein on the lowest level is richer than on any of the upper levels. The Holy Terror Co.'s mill is now running with thirty stamps.

The Bismark mine at Deadwood, owned by the Elizabeth M. Co., has the northern extension of the Holy Terror vein. Under the superintendency of Manager Christopher a 40-stamp mill is being built, which will be ready to operate by November 1.

TEXAS.

There are now forty-six oil gushers in Beaumont, Tex., with a possible production of about 500,000 barrels per day, but the actual production of entire Texas field is said to be not much above 10,000 barrels per day, and oil can be purchased at the wells at 10 cents per barrel. The trouble is that there is a very limited market for the Texas oil product at the present time. The most recent developments are at Damon's Mound, about 100 miles southwest of Beaumont. Here a lighter gravity oil has been found and a 500-barrel well struck at a depth of 580 feet. About a half dozen wells are now drilling and land there has increased from \$1.60 to \$200 per acre.

EDDY COUNTY.

Report comes from Fort Stockton, south of Carlsbad, that petroleum has been struck in great quantities and that a large volume of gas is escaping. The oil was struck at a depth of less than 200 feet.

UTAH.

BEAVER COUNTY.

The Hub M. Co. has been incorporated, capital \$500,000, by E. E. Howell and W. J. Burns of Milford, O. H. Hardy, L. G. Young, O. W. Moyle and O. R. Hardy of Salt Lake. The company owns the Peyton group in the Star mining district.

BOX ELDER COUNTY.

The New Boston G. M. Co. has been incorporated, capital \$40,000. W. F. Smith is president and W. M. Clement secretary and treasurer. The company owns the Boston Nos. 1, 2 and 3, in Park valley.

The Raft River M. Co. has been incorporated by E. D. Woodruff, F. Eberhardt, G. H. Marley, C. C. Smith and J. R. Bowdler of Salt Lake City. The company has a bond on claims in Clear Creek mountains and on the Bald Hornet, New Year, Jose-

phine, Midnight and New Century mining claims, in Park valley.

SALT LAKE COUNTY.

The New England-Utah M. Co. of Chicago, Ill., has been incorporated under Delaware laws; capital, \$1,000,000. D. M. Dickinson of Chicago, Ill., is president. The company owns the Last Chance mine of eleven claims at Bingham. C. Hodge is manager.

WASHINGTON COUNTY.

W. Hatfield of Salt Lake City and J. C. Sullivan of Eureka have bonded the Adams group of copper claims near St. George at, it is said, \$75,000. It is understood that development is to be begun at once.

WASHINGTON.

FERRY COUNTY.

The Monroe G. M. Co. has commenced work on its mine in Republic. The company has a tunnel in 250 feet, and by continuing the tunnel in 70 feet the company expect to crosscut the first of two ledges.

OKANOGAN COUNTY.

Spokane and Okanogan county people have 1081 mining claims on Palmer mountain, at Loomis, including the Palmer Mountain tunnel. The Palmer Mount Mines Con. Co. has been incorporated, capital \$20,000,000 in preferred and common stock, to operate the mines. It proposes to issue \$10,000,000 of 5% gold bonds. Among the plans for future development it is contemplated to continue the present Palmer Mount tunnel, now in nearly 1 mile, to the town of Oro, a distance of 9½ miles. This tunnel will have a grade of 200 feet from Loomis to Oro. At the Oro end of the tunnel a smelter will be erected.

SNOHOMISH COUNTY.

The Bonanza Queen mine, at Silverton, has been sold for \$150,000 to a Minneapolis company. It is said a 200-ton concentrator is to be built.

STEVENS COUNTY.

C. Liungren, of the Cedar Creek Placer M. Co., operating on Cedar creek near Northport, states of the work the company is doing that at a depth of 10 feet they are taking out \$2.85 to \$3.75 per cubic yard. In places where the cement gravel is broken through the wash goes from 40 to 50 cents to the pan. He says they are putting in hydraulic works and will build a mile of ditch and flume.

FOREIGN.

BRITISH COLUMBIA.

T. James, representing a Minneapolis syndicate operating in the Lardeau, has come to San Francisco, Cal., to get a smelter plant for their Lardeau mining property.

A strike has been made on the Aurora, at Moyie. In the shaft, down 18 feet, the ledge widened to 7 feet of solid galena. The Aurora is owned by T. Roder, O. J. Johnson and I. B. Sanborn. Besides the shaft, there is a tunnel in over 300 feet.

Placer gold has been found on Lamb creek, which empties into Moyie lake, near Moyie. As high as fifty-six colors to the pan have been taken out on the surface.

Development work at the St. Eugene, at Moyie, is being done. No shipments are being made, but eighty-five men are employed.

A. L. Davenport of Spokane, Wash., has secured a working bond on the Bayonne claims, between Kootenay lake and the Pend d'Oreille slope, for Ohio people. The bond is reported to call for \$40,000 in a year—\$2000 down. The Bayonne group was discovered this summer by G. Harrison and F. C. Risdon of Ymir. The main vein is a wide one, consisting of free-milling quartz, carrying gold values. A number of samples assayed averaged \$60 per ton. The lowest was \$19.

MEXICO.

The Greene Con. C. Co. in September smelted 12,440 tons of ore and produced 1902 tons of matte, containing 930 tons of copper.

The Pan-American Mines Co. has been incorporated at Cripple Creek, Colo., to operate mines in the Guanajuato district of Mexico. The capital is \$120,000. The incorporators are J. M. Parker, E. H. McElhiney and R. C. Thayer of Cripple Creek, Colo.

J. A. Leonard of Denver, Colo., representing Boston and New York people, has bonded the San Miguel and Tuxtepec mines in the Ures district, near Soyopa, and proposes to open the mines and build a thirty-ton copper smelter. In the Tuxtepec ground are several ledges from 4 to 10 feet in width. In the San Miguel is a ledge 20 feet wide, carrying high-grade ores.

The Mexican M. & S. Co. has been incorporated, capital \$10,000,000, to operate mines in Durango. The office will be in

New York City. H. H. Brady, Jr., of Scranton is the principal party interested.

SIBERIA.

D. V. Evanoff, a mining engineer and geologist, has been examining the Siberian coast opposite Nome this summer. Her reports that he is positive, from the investigations made by him in Siberia, that there is gold there in plenty, and that it would soon be discovered if the country were but thrown open to American miners. He states that the mine-working season there will be considerably longer than that at Nome, on account of the more favorable weather conditions.

THE KLONDIKE.

It is reported that rich placer ground is being mined on Livingstone creek, in the Big Salmon district. It is said \$10,000 has been taken from one cleanup, three days' work of three men. The gold on Livingstone is reported to be very coarse. Livingstone has thus far made the best showing of any creek in the district.

Personal.

H. BRATNOBER is in San Francisco. A. W. HUTCHINS of New York is at the Washington mine, Forest Hill, Cal. W. F. NEWELL of San Francisco, Cal., is in Nevada looking for iron ore deposits. A. H. MAYNE of Joplin, Mo., is investigating the zinc ores at Park City, Utah. H. O. CHOATE, M. E., of Cleveland, O., has been examining mines at Silver City, N. M. L. D. FAY, M. E., of Houghton, Michigan, is examining a mine proposition at Park City, Utah. W. H. BREVOORT, manager of the Victor Jr. mine at Leland, Or., is in Salt Lake City, Utah. DANA HARMON has resigned as Supt. of the California mine at Gaston Ridge, Nevada county, Cal. H. S. SANDS is electrical engineer at the Seaton Mountain Light & Power Co., Idaho Springs, Colo. A. HAWKINS of Nevada City, Cal., has accepted an appointment as foreman of a mine near Tucson, Arizona. J. POUNDSTONE of Arizona has been appointed superintendent of the Gaston Ridge M. Co. in Nevada county, Cal. J. B. FLEMING, late of the Silver King at Park City, Utah, is now in charge of the mill of the Tesora mine at Tintic. L. V. DORSEY, superintendent of the Maryland mine at Grass Valley, Cal., has returned there from San Francisco, Cal. MARION AUBURY has returned to San Francisco from a reconnaissance through San Bernardino and San Diego counties, Cal. J. W. DUNLAP, Supt. of the Devil's Basin mine at Deadwood, Placer county, Cal., has returned there from a sojourn in San Francisco. CHAS. H. MORRIS, Georgetown, Colo., is manager of the Altura, Mexico-Seneca and New York & Colorado groups of mines at that place. C. W. RAYMOND, M. E., has resigned the superintendency of the Crystal Lake G. M. Co., operating at Meadow Lake, Nevada county, Cal. JAS. C. H. FERGUSON, Pacific coast sales agent The Midvale Steel Co., leaves San Francisco this week on a six weeks' visit to New York and Philadelphia. W. H. STORMS, author of "Mine Timbering," now superintending mining operations in Amador county, Cal., has returned to Sutter Creek, Cal., from San Francisco. PROFESSOR S. B. CRISTY, dean of the College of Mining, University of California, has been elected a member of the Institution of Mining and Metallurgy of Great Britain. N. D. PORTER of Chicago, Ill., has been appointed Supt. of the Stone Creek M. Co. at Dillon, Mont., taking the place made vacant by the murder of the former Supt., W. S. Millsbaugh. S. F. EMMONS of the U. S. Geological Survey, who has been during the summer making an examination of the Leadville district, Colorado, is now in Arizona examining the copper regions at Globe and Bisbee. CHARLES D. WALCOTT, director of the U. S. Geologic Survey, is now in Arizona, inspecting the work of the irrigation survey there, after which he will come to California, sojourning at Los Angeles and later at San Francisco.

Obituary.

C. S. BATTERMAN, Supt. of the Boston & Montana M. Co. at Butte, Mont., died in that city on the 7th inst., aged 45 years. Deceased was a native of Califor-

nia and a graduate of the University of California of the class of 1879. He was a mining engineer of high repute and had been connected with many large mining enterprises in Nevada, Colorado and at Butte, Mont., before he became Supt. of the Boston & Montana Co. Socially, he will be missed by a wide circle of friends throughout the West, who feel deeply his death.

Commercial Paragraphs.

THE Atlas pipe wrench was awarded the first prize at the Pan-American Exposition at Buffalo, as was also the Atlas tube cleaner.

THE Lunkenheimer Co., of Cincinnati, Ohio, has again carried off high honors, this time at the Pan-American Exposition, by being awarded the gold medal on valves, lubricators and engine fittings.

F. I. MATTHEWS, proprietor Bay City Iron Works, Oakland, Cal., has moved into his new three-story brick building, corner Third and Washington streets. The new works are equipped with modern machinery.

THE Standard Smelting & Refining Co. has contracted with the Colorado Iron Works, Denver, Colo., for the erection of a large concentrating plant on land adjoining the Val Verde smelter on the Agua Fria. The Colorado Iron Works is to make the machinery, erect the plant and turn it over to the Smelting & Refining Co. complete and ready for operation.

THREE heavy steam hammers have been added to the equipment of the Baker Iron Works, Los Angeles, Cal., to meet the increasing demands upon them for prompt deliveries of large forgings to their mining trade. Southwestern mining men find their orders are filled promptly from Los Angeles, and the Baker Iron Works is prepared to fill their orders understandingly.

THE Robins Conveying Belt Co. have been awarded a gold medal for their exhibits at the Pan-American Exposition at Buffalo, the highest award. At the Paris Exposition they received the Grand Prix. Their exhibits at Buffalo consisted of two full size 20-inch conveyors with automatic self-reversing tripper in operation in the Machinery and Transportation Building and two model belt conveyors, on a scale of 3 inches to the foot, with automatic self-reversing tripper, in the Mining Building. The conveyors have been in operation every day since the Exposition opened and have attracted considerable attention.

Books Received.

Volume VI of The Twenty-first Annual Report of the United States Geological Survey, 1291 pages in two parts, quarto, has been issued by the Government Printing Office at Washington, D. C. This volume of the Report has been prepared under the supervision of Hon. Charles D. Walcott, director of the Survey, by David T. Day, geologist in charge, and deals with the mineral resources of the United States, both metallic products and coal and coke for the year 1899. The work is exceedingly complete in its statistical features and includes comparisons with the production and more or less explanatory description of the resources of foreign countries. While much of the matter has been anticipated in the advance sheets, very properly published as they were written, and before the matters they treated of became of historical interest merely, the volume is a valuable addition to the live library of mining books, useful as reference on many points that have technical interest to the geologist and mining engineer and commercial interest to mine managers and operators.

Catalogues Received.

The Colorado Lamp Co., Denver, Colorado, send a handsome booklet descriptive of their electric incandescent lamps, and, incidentally, giving considerable information on incandescent lamps, voltage, candle power, etc. Illustrations and graphic charts add to the value of the treatise which will be sent anywhere on request.

Recently Declared Mining Dividends.

| | |
|-------------------------------------------------------------------------|---------|
| Rocco-Homestake M. Co., Nevada, monthly, 1½ cent per share, \$4500. | Oct. 12 |
| Modoc M. Co., Colorado, monthly, 1 cent per share, \$5000. | Oct. 15 |
| Gwin Mine Dev. Co., California, No. 26, 5 cents per share, \$5000. | Oct. 15 |
| Boston & Butte C. M. Co., Montana, quarterly, \$3 per share, \$600,000. | Nov. 1 |
| Con. Mercur M. Co., Utah, quarterly, 12½ cents per share, \$125,000. | Nov. 1 |

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING OCTOBER 8, 1901.

683,899.—PRESERVING FOOD.—S. Bishop, S. F.
684,045.—WATER WHEEL.—F. H. Cook, Mead, Wash.
684,052.—SNOW REMOVER.—H. S. Farquhar, S. F.
684,211.—FISH HOOK.—W. F. Forch, Los Angeles, Cal.
683,924.—ELEVATOR SYSTEM.—E. M. Fraser, S. F.
684,363.—WELL CASING.—F. A. Garbutt, Los Angeles, Cal.
684,369.—TEXTILE FABRIC.—W. A. Hagans, Los Angeles, Cal.
684,232.—WRENCH.—W. T. Hatten, Heppner, Or.
684,254.—SPEED GOVERNOR.—C. A. Huffmaster, San Leandro, Cal.
681,258.—CONCRETE BEAM.—P. H. Jackson, S. F.
684,275.—CAN HEAD COATING MACHINE.—A. W. Livingston, S. F.
685,075.—WEIGHING MACHINE.—Mackey & Gilbert, Rye, N. Y.
684,234.—DARK ROOM.—T. McCusker, Portland, Or.
684,293.—BURIAL CASKET.—J. C. F. McGriff, S. F.
684,297.—HINGE.—O. Niehaus, West Berkeley, Cal.
684,307.—ENGINE.—P. H. Reardon, S. F.
683,987.—ROTARY ENGINE.—M. J. Robinson, Los Angeles, Cal.
681,384.—INK WELL.—D. H. Rowe, East Oakland, Cal.
684,311.—BOAT.—S. R. Ruj, S. F.
684,312.—GARMENT HOLDER.—J. D. Rush, San Diego, Cal.
684,116.—MOP.—C. E. Shaw, Spokane, Wash.
684,322.—MOTOR VEHICLE.—A. C. Stewart, Santa Paula, Cal.
684,006.—GAUGE.—C. Stout, Pomona, Cal.
684,324.—BALING PRESS.—T. J. Thorp, Forest Grove, Or.
684,154.—WEED CUTTER.—J. D. Whitman, Medford, Or.
35,175.—DESIGN.—J. P. Budd, Everett, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INK WELL.—D. H. Rowe, East Oakland, Cal., as signor to True, Rowe & Co., of same place. No. 684,384. Oct. 8, 1901. This invention consists in a means for operatively attaching the cover to a fixed ink well, for the purpose of preventing dust from entering and to conveniently open and close the well. The top of the well is grooved about the circumference, has an opening in the vertical wall, and the cover has a depending flange to fit over the top, and has also an opening which is adapted to register with the opening of the well by turning in one direction, and by turning in the other direction, a projecting lip covers the opening in the well and seals it. The cover is retained in place by the ends of an elastic bail, which ends pass through holes in the cover and enter the circumferential groove. By springing these ends out of the groove, the cover can be entirely removed.

PORTABLE CONCRETE BEAM.—P. H. Jackson, San Francisco, Cal. No. 684,258. Oct. 8, 1901. The object of this invention is to provide a composite beam for use in connection with building. It consists of a flat metal tie curved from end to end, forming a bottom surface and having an abutting metal end or skewback, and a filling of concrete material resting upon the tie and extending between the end plates.

GARMENT HOLDER.—J. D. Rush, San Diego, Cal. No. 684,312. Oct. 8, 1901. This clothes hook or garment holder consists of a right-angled triangular piece of metal having a vertical portion adapted to bear against the wall or support; depressions formed in the horizontal upper portion and intermediate portions having a broad, flat top surface; the depressions having substantially horizontal bottoms and the walls inclined downward and outward to prevent the too easy detaching of anything hanging thereon. The inclined outer portion of the hypotenuse of the triangle has hooks also formed upon it, and the vertical portion has a means by which it can be secured against the wall.

AUTOMATIC CAN HEAD COATING MACHINE.—A. W. Livingston, San Francisco, Cal. No. 684,275. Oct. 8, 1901. The object of this invention is to coat the flanges of can heads with a sealing compound preparatory to subsequent insertion of the heads upon the can bodies. It comprises the reservoir carried upon a revolving support, a feed roller dipping into the reservoir, a distributing roller adapted to bear upon the side to be coated, a roller adapted to bear upon the opposite side of the flange, and means by which these rollers and heads are revolved, the head being actuated by a lever therefrom and delivered in a vertical position into a flaring trough. By means of an endless belt or chain the head is carried through this trough and is then in readiness for use.

VARIABLE SPEED GOVERNOR.—C. A. Huffmaster, San Leandro, Cal. No. 684,254. Oct. 8, 1901. This invention is designed to provide a governor by which the speed of an engine is controlled to any desired degree. It comprises a friction roller upon the sleeve of a governor, a driver engaging this roller and operating the governor, said roller being slidable lengthwise of the sleeve and radial of the driver. A spring keeps the driver automatically in contact with the roller, and means are provided by which the roller is moved upon the sleeve, and connections are made between the driver and the engine so that the latter is controlled at will, and the speed of the governor is varied inversely as the speed of the engine.

BURIAL CASKET.—J. C. F. McGriff, San Francisco, Cal. No. 684,293. Oct. 8, 1901. This invention relates to a receptacle for the bodies of deceased persons. It consists of a case comprising a single unitary structure devoid of lateral joints and of greater length than the body to be received, and means by which the case is opened, and the circular opening at one end; and a carriage or body support is arranged to be introduced through this opening, after which the opening is closed by a screw-threaded cap or head having an annular flange, and means for making a tight joint. A small opening is made in the opposite end of the case by which the steam or gas which the case may be tested, or preservative injected at will. The cap by which the main opening is closed has a suitable lock by which it is secured after being properly closed.

Latest Market Reports.

SAN FRANCISCO, Oct. 17, 1901.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c (1000 fine); San Francisco, 57½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22c@23c. London: £65 5s per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots, 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £11 7s 6d per ton=2.47 cents per lb.

SPELTHER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13c@15c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; 200 lbs., 28½c; less, 29c; bar tin, 30c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

NICKEL.—New York, 50c@60c per lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

PHOSPHORUS.—F. o. b. New York 50c@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

PLATINUM.—San Francisco, crude, \$19 per oz.; New York, \$20.50 per Troy oz. BISMUTH.—New York, 3½c, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, 3½c, 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9½c per set; 14 oz., 40s., 8½c.

OILS.—Lined, pure, boiled, bbl., 74c; cs., 79c; and bbl., 74c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naptha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50c@52½c; cs., 55c@57½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 31½c@32c per lb.; carloads, 29c@30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½c B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2½c@3c per lb.; blue vitriol, 5½c@6c per lb.; borax, concentrated, 7c@8c per lb.; chlorate of potash, 12c@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½c@2½c; California refined, 1½c@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3c@4c per lb.; Cal. s. soda, bbls., \$1.00; sds, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

SITUATIONS WANTED.

ENGINEER AND CHEMIST, several years' practice in mining and chemical works, is open for an engagement. Address Box 304, Mining and Scientific Press office.

Young Mining Engineer desires position. Scientific and practical training, six years' experience. Mine and surface surveying; neat and accurate draughtsmen; assaying, etc. Accustomed to handling men. Excellent references. Address Box 92, Mining and Scientific Press office.

THOROUGHLY COMPETENT ENGINEER desires position as Mine or Stamp Mill Superintendent. Address S. J. H., care Mining and Scientific Press office.

WANTED.—Position by a first-class mining man of wide experience. Thoroughly practical in mine, mill or concentrating plant. Can manage men with skill and economy, and up to date in business and good management. First-class testimonials. Address Box 400, Mining and Scientific Press office.

WANTED.—Position as superintendent or general foreman of a copper smelter or Bessemer plant. Eighteen years' experience. Speak Spanish. Thorough knowledge of carbonate or sulphide ores. References exchanged. Address Box 601, care Mining and Scientific Press.

WANTED.—Position by a practical mine foreman in America or Mexico. Have twenty-one years' experience in gold, silver, copper, lead and tin mines. Speak Spanish. Have best of recommendations. Modest salary required. Address J. R. H., care Mining and Scientific Press.

WANTED.—SITUATION BY A PRACTICAL mill man, assayer and cyanide man; is also a practical miner. Understands mine bookkeeping. No objection to Mexico. Best of references. Address W., care Mining and Scientific Press office.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

MINING ENGINEER, graduate Mass. Inst. Tech., with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and steam oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

ASSESSMENT NOTICES.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1901, an assessment (No. 2) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 55 120 Sutter Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on MONDAY, the 21st day of October, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.
120 Sutter Street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 11th day of September, 1901, an assessment (No. 24) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of October, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of November, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

TANANA MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of September, 1901, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, San Francisco, California.

THE THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 632 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. FREY, Secretary.
Office—632 Sacramento street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of October, 1901, an assessment (No. 4) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.
Office—Room 801, Claus Spreckels Building, San Francisco, California.

Mica Axle Grease

that makes your horses glad.

Made by Standard Oil Co.

ONCE IN A LIFE TIME

is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON

lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 60 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel hounds.

THOUSANDS NOW IN DAILY USE.
Don't buy a wagon until you get our free book, "Wagon Savings," ELECTRIC WHEEL CO., Box 232, Quincy, Ill.

PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions, patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

## Mining Machinery

There are  
reasons  
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeannesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeannesville Pumps.

We claim that in Jeannesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

**JEANESVILLE IRON WORKS CO.,**

Hydraulic Pressure Pumps,  
Heavy Liquid Pumps,  
Vacuum Pumps.

Extra parts of all sizes of MARSH Pumps carried in stock and repairing done in the best manner.

We also set up our pumps when required at cost and guarantee every pump to give satisfaction.  
Our New Pump Catalogue Will Be of Interest to You. Mailed Free. Send for One.  
**SIMONDS SAW CO., 33 Market St., San Francisco, Cal.**

## The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

**H. J. PUTMAN & CO.**

23 BRIDGE SQUARE. MINNEAPOLIS, MINN.

Perfectly fitting joints, in any mine timber construction, mean greater safety, and a longer life for the timber work.

# Put on Your Roofing Now

Don't put off putting on your roofing—don't wait until the first storm begins to trickle through and ruins the plaster.

Get your ready roofing ready and set the men to work. No matter how much you are in a hurry, however, stop long enough to find out all about P & B Ready Roofing.

Read what we say in our booklets—ask builders about it—ask the tenants how they like it—ask owners if it does not save them worry and repair expense—ask every person who knows what a real good roofing is—knows P & B Ready Roofing from a personal experience standpoint—inquire fully—then you will want P & B Ready Roofing, for it is the only ready roofing made that hasn't any of the faults of other roofings.

For instance, it is almost fire proof, it is absolutely water proof—rats, mice and insects won't touch it, hot weather won't expand or melt it, cold will not crack nor contract it, wind won't move it, dampness won't rot it and dust cannot get under it. There is absolutely nothing that can injure or affect injuriously P & B Ready Roofing, but time and it runs time a long, long race.

Another thing—P & B Ready Roofing comes in rolls, can be easily carried, conveniently handled, quickly laid, and the freight classification is very low.

Furthermore, anyone can lay P & B Ready Roofing, for all the necessary nails, cement, paint, etc., go with each roll.

Send for our booklet for further information. Address Department A and you will receive a quick reply.

**Assayer and Analytical Chemist,**  
120 North Main St. - Los Angeles, Cal.

**JAMES W. NEILL,**  
Metallurgist and Mining Engineer,  
Box 1164. Salt Lake City, Utah.

**HERCHE BROS., Millwrights and Engineers.**  
Construction and Erection of Quartz Mills,  
Hoisting Works, etc. Hydraulic Power Installations.  
Plans and Estimates Furnished. 519  
Mission St., San Francisco. Phone Black 4017.

**SANDS & WOOD, Consulting Engineers,**  
502-504 Charles Building, Denver, Colo.  
ELECTRICAL POWER TRANSMISSION  
and ELECTRICAL MINING MACHINERY.

**R. G. LEGG,**  
MINES AND MINING PROPERTY  
Examined and Reported Upon.  
61 Seventh East St. Salt Lake City, Utah.

**HOWARD E. BURTON,**  
**ASSAYER and CHEMIST,**  
111 E. Fourth St., LEADVILLE, COLO.  
Specimen prices: Gold, 50c; Gold & Silver, 75c;  
Gold, Silver & Lead, \$1; Gold, Silver & Copper,  
\$1.50; Silver or Lead, 35c; Copper or Zinc, \$1.  
Mailing envelopes sent to any address.

**ALMARIN B. PAUL, M. E.,**  
ROOM 27, CROCKER BUILDING, SAN FRANCISCO.  
Will act as AGENT for the sale of RELIABLE  
Mining Property. Also for securing suitable  
machinery for fairly developed gold mines in  
California, for interests in the same.

**RALPH E. STEVENS,**  
ATTORNEY AND COUNSELOR,  
43-44 Jacobson Building, DENVER, COLO.  
Special attention to examination of titles,  
Corporation, commercial, mining law. Collections  
receive prompt attention. Notary in office.  
Refers to Denver representative of Mining and  
Scientific Press.

**CHARLES M. FASSETT,**  
Assay Office and  
Ore Testing Works,  
702 Main Ave., SPOKANE, WASH.  
REPORTS ON MINING AND METAL-  
LURGICAL PROPOSITIONS.

**School of Practical Mining, Civil,  
Mechanical and Electrical Engineering.**  
Surveying, Architecture, Drawing, Assaying,  
Cyanide Process and Metallurgy.  
113 Fulton St., one block west of City Hall, S. F.  
OPEN ALL YEAR. A. VAN DER NAILLEN, Pres.  
Assaying of Ores, Es., Bullion and Chlorination  
Assay, Es., Blowpipe Assay, Es. Full course  
of Assaying, \$50. Established 1864.  
Send for Circular.

**LOUIS FALKENAU,**  
**STATE ASSAY OFFICE,**  
538 Sacramento St., below Montgomery.  
Analysis of Ores, Metals, Soils, Waters, Industrial  
Products, Foods, Medicines, etc., etc.  
Court Experting in all branches of Chemical  
Technology. Working Tests of Ores and In-  
vestigation of Metallurgical and Manufacturing  
Processes. Consultations on all questions  
of applied chemistry. Instructions given in  
assaying and all branches of chemistry.

**ABBOT A. HANKS,**  
**CHEMIST AND ASSAYER.**  
Successor to Henry G. Hanks, est.  
1866. The supervision of sampling  
of ores shipped to  
San Francisco a  
specialty.  
531—  
California Street,  
San Francisco.

**ERNEST H. SIMONDS,**  
Late Instructor in Assaying, University of  
California.  
**ASSAYS AND ANALYSES.**  
**LABORATORY TESTS OF ORES.**  
SPECIAL ATTENTION GIVEN TO THE  
INSTRUCTION OF STUDENTS.  
REMOVED TO LARGER QUARTERS  
at 417 Montgomery St., bet. California  
and Sacramento Sts., Third Floor, San  
Francisco, Cal.

— BUILD THE —

### "Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work in Sizes from 3 to 300 h. p. in actual use

"UNION" COMBINED HOISTS in Sizes from 3 to 130 h. p. in actual use.

"UNION" COMBINED COMPRESSORS—30, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 300 h. p., of Single, Double and Four-Cylinder Types.

FIFTEEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are In Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

Office, 248 First Street. Works, Corner First and Clementina Streets. SAN FRANCISCO, CAL.

### Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

#### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.

TESTING WORKS, 1716 BLAKE ST. 208-210 McPHEE BLDG., DENVER, COLO.
